CHAPTER 25

SEPTIC TANKS, SOIL ABSORPTION SYSTEMS, AND OTHER SMALL WASTEWATER SYSTEMS

Section 1. Authority.

This rule is promulgated pursuant to Wyoming Statutes (W.S.) 35-11-101 through 35-11-1904, specifically 35-11-302(a)(iii).

Section 2. Objective.

This Chapter contains the minimum standards for the design and construction of small wastewater systems that are defined by W.S. 35-11-103(c)(ix). In addition, this Chapter contains the minimum standards for the design and construction of Underground Injection Control (UIC) Class V facilities 5C1-5C3, 5C6, 5D1, 5E1, 5E3-5E5 as defined in Chapter 27, Appendices C and D.

The following situations will require the application package to be sealed, signed, and dated by a professional engineer (PE): non-domestic wastewater from commercial and industrial facilities, high strength wastewater, individual permits to construct, or standard soil absorption systems with a soil percolation rate that is either less than 5 minutes per inch (mpi) or more than 60 minutes per inch (mpi).

These standards pertain to permits required pursuant to Chapters 3 and 25, Wyoming Water Quality Rules and Regulations. The installation of all components of a small wastewater system require a permit to construct. Permits to construct are specified throughout this chapter as general permits, described in Chapter 3, Section 7; permit by rule, described in Chapter 3, Section 8; or as individual permits to construct, described in Chapter 3, Section 6.

Section 3. Timing of Compliance with These Regulations.

Any Chapter 3 permit-to-construct issued for facilities subject to this chapter prior to the effective date of these regulations, and any facility authorized under the Division's "General Permit to Construct, Install, Modify or Operate a Small Wastewater Facility" shall remain covered under those permits. New construction or modification of existing facilities following the effective date of this regulation must obtain authorization under a new permit.

Section 4. Definitions

(a) "100 year floodplain" means a tract of land throughout a watershed that has a one-in-one hundred chance or occurrence of flooding in any given year or a return period of once every 100 years, as determined by the United States Geological Survey (USGS), Federal Emergency Management Agency (FEMA) or a local planning and development authority.

(b) "Absorption surface" means the interface where treated effluent infiltrates into

47 native or fill soil.

48

49 (c) “Bed” means a soil treatment and dispersal system where the width is greater than
50 three (3) feet.

51

52 (d) “Bedrock” means geological layers, of which greater than fifty percent (50%) by
53 volume consist of unweathered in-place consolidated rock or rock fragments. Bedrock also
54 means weathered in-place rock that cannot be hand augered or penetrated with a knife blade.

55

56 (e) “Bedroom” means any room that is or may be used for sleeping.

57

58 (f) “Blackwater” means water containing fecal matter and/or urine.

59

60 (g) “Five day biochemical oxygen demand (BOD5)” means a measurement of the
61 dissolved oxygen used by microorganisms in the biochemical oxidation of organic matter during
62 a five (5) day period.

63

64 (h) “Building sewer” means the pipe that carries wastewater from the building.

65

66 (i) “Chamber” means a domed open bottom structure that is used in lieu of
67 perforated distribution pipe and gravel media.

68

69 (j) “Delegated small wastewater program” means a local governmental entity,
70 delegated by the Administrator, with the authority to administer the provisions of W.S. 35-11-
71 301(a) (iii) for small wastewater systems pursuant to the provisions of W.S. 35-11-304.

72

73 (k) “Direct human consumption food crops” are crops consumed directly by humans.
74 These include but are not limited to fruits, vegetables, and grains grown for human consumption.

75

76 (l) “Domestic wastewater” means a combination of the liquid or water-carried wastes
77 from residences, business buildings, institutions, and other establishments arising from normal
78 living activities.

79

80 (m) “Domestic septage” means liquid or solid material removed from a waste
81 treatment vessel that has received only wastes from residences, business buildings, institutions,
82 and other establishments arising from normal living activities.

83

84 (n) “Dosing tank” means a tank equipped with an automatic siphon or pump designed
85 to discharge effluent on an intermittent basis.

86

87 (o) “Effluent” means liquid flowing out of a septic tank, other treatment vessel, or
88 system.

89

90 (p) “Effluent filter” means a removable, cleanable device inserted into the outlet
91 piping of a septic tank or other treatment vessel designed to trap solids that would otherwise be
92 transported to the soil absorption system or other downstream treatment components.

- 93
94 (q) “Evapotranspiration” means the combined loss of water from soil by evaporation
95 from the soil or water surface and by transpiration from plants.
96
- 97 (r) “Greywater” means untreated wastewater that has not been contaminated by any
98 toilet discharge; that is unaffected by infectious, contaminated, or unhealthy bodily wastes; and
99 does not present a threat from contamination by unhealthful processing, manufacturing, or
100 operating wastes. “Greywater” includes but is not limited to wastewater from bathtubs, showers,
101 washbasins, clothes washing machines (unless soiled diapers are serviced), laundry tubs, and
102 kitchen sinks.
103
- 104 (s) “Grease interceptor” means a device designed to separate fats, oils, and grease
105 from wastewater.
106
- 107 (t) “Groundwater” means subsurface water that fills available openings in rock or
108 soil materials such that they may be considered water saturated under hydrostatic pressure.
109
- 110 (u) “High groundwater” means seasonally or periodically elevated levels of
111 groundwater.
112
- 113 (v) “High strength wastewater” means a wastewater stream with a BOD5 higher than
114 200 mg/L.
115
- 116 (w) “Holding tank” means a watertight receptacle designed to receive and store
117 wastewater.
118
- 119 (x) “Manifold” means a non-perforated pipe that distributes effluent to individual
120 distribution pipes.
121
- 122 (y) “Mound system” means an onsite wastewater system where any part of the
123 absorption surface is above the elevation of the existing site grade and the absorption surface is
124 contained in a mounded fill body above the grade.
125
- 126 (z) “Mulch basin” means an excavated area that has been refilled with a highly
127 permeable media, organic and inorganic materials intended to distribute greywater to irrigate
128 vegetation.
129
- 130 (aa) “Pathogens” are disease-causing organisms. These include, but are not limited to
131 certain bacteria, protozoa, viruses, and viable helminth ova.
132
- 133 (bb) “Percolation rate” means the time expressed in minutes per inch required for
134 water to seep into saturated soil at a constant rate.
135
- 136 (cc) “Pipe invert” means the bottom of the internal surface of the pipe.
137
- 138 (dd) “Percolation test” means the method used to measure the percolation rate of water

139 into soil as described in Appendix A.

140

141 (ee) “Permit by rule” means an authorization included in these rules that does not
142 require either an individual permit or a general permit. A facility that is permitted by rule must
143 meet the requirements found in this chapter, but is not required to apply for and obtain a permit
144 to construct and operate the facility.

145 (ff) “Pressure distribution” means a network of pipes in which effluent is forced
146 through orifices under pressure.

147

148 (gg) “Restrictive layer” means a nearly continuous layer that has one or more physical
149 or chemical properties that significantly impede the movement of water and air through the soil
150 or that restrict roots or otherwise provide unfavorable root conditions. Examples are bedrock,
151 cemented layers, and dense layers.

152

153 (hh) “Septage” means liquid or solid material removed from a waste treatment vessel
154 that has received wastes from residences, business buildings, institutions, and other
155 establishments.

156

157 (ii) “Septic tank” means a watertight tank designed and constructed to receive and
158 treat raw wastewater

159

160 (jj) “Serial distribution” means a group of trenches arranged so that the total effective
161 absorption area of one trench is used before liquid flows into the next trench.

162

163 (kk) “Service provider” means a person authorized and trained by a system
164 manufacturer or their vendor to operate and maintain any proprietary system.

165

166 (ll) “Soil absorption system” means a shallow, covered, excavation surface, or mound
167 made in unsaturated soil into which wastewater effluent from the septic tank is discharged
168 through distribution piping for application onto absorption surfaces through porous media or
169 manufactured components.

170

171 (mm) “Trench” means an absorption surface with a width of three (3) feet or less.

172

173 **Section 5. Design Flows.**

174

175 The volume of wastewater shall be determined by one of the following:

176

177 (a) Tables 1 and 2 provided in this section.

178

179 (b) Metered water supply data from the facility.

180

181 (c) Metered water supply data from another facility where similar water demands
182 have been demonstrated.

183

184

185 **Table 1. Residential Design Flow Rates per Bedroom (gallons per day, gpd)¹**

1 bedroom	150
2 bedrooms	280
3 bedrooms	390
4 bedrooms	470
5 bedrooms	550
6 bedrooms	630

186 ¹An unfinished basement is considered two (2) additional bedrooms.187 ²The design flow shall be increased by eighty (80) gpd for each additional bedroom over six (6).

188

189

Table 2. Non-Residential Wastewater Design Flow Rates¹

Facility	Unit	Flow (gallons/unit/day)
Airports	person	4
Apartment	bedroom	120
Automobile Service Station	vehicle served	10
Bars	seat	20
Bathhouses and swimming pools	person	10
Campgrounds (w/ toilets only)	person	25
Campgrounds (w/shower facility)	person	45
Church	person	4
Country Club	member	25
Day School, Office Building, Retail Store, Warehouse (no showers)	person	15
Hospital	bed	250
Industrial Building (sanitary waste only)	employee	20
Laundry (self-service)	machine	450
Mobile Home	bedroom	see table 1
Motel, Hotel, Resort	bedroom	140
Recreational Vehicle	each	100
Rest Home, Care Facility, Boarding School	bed	100
Restaurant	meal	10
Restaurant (kitchen waste only)	meal	6
Theater	seat	3

190 ¹Values shown in the above table are the typical flow rates from *Wastewater Engineering*

191 *Treatment and Reuse*, Metcalf and Eddy, 2003.

192

193 **Section 6. Systems Not Specifically Covered by This Rule.**

194

195 This section is provided to encourage new technology and equipment and provide a process for
196 evaluating and permitting designs that deviate from this rule. The proposed construction of
197 facilities and processes not in compliance with this rule may be permitted provided that the
198 facility, when constructed and operated, meets the objective of these rules.

199

200 (a) Each application for a permit to construct shall include an engineering design
201 report, detailed construction plans, and technical specifications for all piping, tanks, and
202 equipment. All of the documents shall have a suitable title showing the owner's name and the
203 Wyoming registration number, seal, and signature of the engineer.

204

205 (b) Each application for a permit to construct will be evaluated on a case-by-case
206 basis using the best available technology. The application shall include at least one of the
207 following:

208

209 (i) Data obtained from a full scale, comparable installation that demonstrates
210 the acceptability of the design.

211

212 (ii) Data obtained from a pilot plant operated under the design condition for a
213 sufficient length of time to demonstrate the acceptability of the design.

214

215 (iii) Data obtained from the theoretical evaluation of the design that
216 demonstrates a reasonable probability the facility will meet the design objectives.

217

218 (iv) An evaluation of the flexibility of making corrective changes to the
219 constructed facility in the event it does not function as planned.

220

221 (c) If an applicant wishes to construct a pilot plant to provide data necessary to show
222 the design will meet the purpose of the act, a permit to construct must be obtained.

223

224 **Section 7. Site Suitability.**

225

226 (a) Small wastewater systems must be located where the surface drainage is sufficient
227 to allow proper operation of the small wastewater system. Avoid depressions and bases of slopes
228 and areas in the path of runoff from roofs, patios, driveways, or other paved areas unless surface
229 drainage is provided. Small wastewater systems shall not be located beneath buildings, parking
230 lots, roadways, driveways, irrigated landscaping, or compacted areas.

231

232 (b) The site must include area for both the proposed soil absorption system and a
233 future replacement soil absorption system. Both the proposed and replacement soil absorption
234 systems shall be sized to receive one-hundred (100%) percent of the wastewater flow. If a trench
235 system is used, the replacement soil absorption system may be located between the trenches of

236 the proposed soil absorption system if there is at least nine (9) feet of spacing between trench
 237 sidewalls.

238
 239 (c) For standard soil absorption systems, effective suitable soil depth shall extend at
 240 least four (4) feet below the bottom of the soil absorption system to any restrictive layer,
 241 fractured rock, or highly permeable material.

242
 243 (d) The depth to high groundwater shall be at least four (4) feet below the bottom of
 244 the absorption surface for all treatment systems except pressure distribution. For pressure
 245 distribution systems, the depth to high groundwater shall be at least three (3) feet below the
 246 bottom of the absorption surface if the percolation rate of the soil is five (5) minutes per inch or
 247 greater (5-60 mpi).

248
 249 (e) Slope

250
 251 (i) Table 3 shows the maximum permissible slopes of the site on which an
 252 absorption system may be constructed

253
 254 **Table 3. Slope and Percolation Rates for Absorption Systems**

Percolation Rate (minutes/inch)	Maximum Slope ¹
5	25%
6-45	20%
46-60	15%

255 ¹ Flatter slopes may be required where the effluent surfaces downslope.

256
 257 (ii) Serial distribution, with the use of drop boxes or approved fittings, is the
 258 preferred installation method for sloping terrain. The bottom of individual trenches shall be level
 259 and the trenches shall be constructed to follow the contours of the land.

260
 261 (iii) The placement of multiple trenches, with each subsequent trench down
 262 slope of the previous trench shall be avoided when the addition of effluent to the soil absorption
 263 system trenches may lead to either an unstable slope or seepage down slope.

264
 265 (iv) All absorption surfaces must be located at least 15 horizontal feet from the
 266 top of any break in slope that exceeds the maximum slope allowed.

267
 268 (f) Soil Exploration Pit and Percolation Tests

269
 270 (i) Delegated small wastewater programs shall require a percolation test in
 271 addition to the soil exploration pit.

272
 273 (ii) A minimum of one soil exploration pit within the proposed soil absorption
 274 system location shall be excavated to a minimum depth of four (4) feet below the bottom of the
 275 proposed soil absorption system to evaluate the subsurface conditions.

276 (iii) The percolation test shall be performed in accordance with Appendix A of
 277 this chapter. An evaluation of the soil texture, in the proposed soil absorption system location,
 278 by a person experienced in soils classification, may be used as an additional tool to confirm the
 279 percolation rate.

280
 281 (g) Minimum horizontal setback distances (in feet) are as follows:
 282

283 **Table 4. Minimum Horizontal Setbacks for Domestic Wastewater in Feet^{1, 2}**

From	To Septic Tank Or Equivalent	To Absorption System
Wells (includes neighboring wells)	50	100
Public Water Supply Well	100	200 ²
Property Lines	10	10
Foundation Wall (w/o drains)	5	10
Foundation Wall (with drains)	5	25
Potable Water Pipes	25	25
Septic Tank	N/A	10
Surface Water, Spring (including seasonal and intermittent)	50	50
Cisterns	25	25

284 ¹ For disposal of non-domestic wastewater, the setback distance shall be determined by a
 285 hydrogeological study in accordance with Section 17(b) of Chapter 3, but shall not be less than
 286 the distances shown in Table 4.
 287

288 ² Small wastewater systems that discharge to the same aquifer that supplies a public water supply
 289 well and are located within Zone 1 or 2 (Attenuation) of the public water supply well, as
 290 determined by *Wyoming Department of Environmental Quality Source Water Assessment Project*
 291 *(2004)* or as established in Section 2 of the *Wyoming Wellhead Protection Guidance Document*
 292 *(1997)*, shall provide additional treatment. These systems will be required to obtain an
 293 individual permit to construct and will require that a PE sign, stamp, and date the application, as
 294 stated in Section 2 of this chapter. The additional treatment shall be in accordance with Chapter
 295 3 Section 2(b)(ii). The treatment system shall be designed to reduce the nitrates to less than 10
 296 mg/L of NO₃- as N and provide 4-log removal of pathogens before the discharge leaves the
 297 property boundary of each small wastewater system.
 298

299 **Section 8. Soil Absorption System Sizing.**

300
 301 (a) The total infiltration surface area of a soil absorption system shall be calculated
 302 by dividing the design flow rates (gpd) from Table 1 or Table 2 by the loading rate (gpd/ft²)
 303 found in Table 5.
 304
 305

306

Table 5. Rates of Wastewater Application for Soil Absorption System Areas

Percolation Rate (mpi)	Loading Rate (gpd/ft ²)	Percolation Rate (mpi)	Loading Rate (gpd/ft ²)
5	0.80	21	0.45
6	0.75	22	0.44
7	0.71	23-24	0.43
8	0.68	25	0.42
9	0.65	26-27	0.41
10	0.62	28-29	0.40
11	0.60	30-31	0.39
12	0.58	32-33	0.38
13	0.56	34-35	0.37
14	0.54	36-37	0.36
15	0.52	38-40	0.35
16	0.50	41-43	0.34
17	0.49	44-46	0.33
18	0.48	47-50	0.32
19	0.47	51-55	0.31
20	0.46	56-60	0.30

307

(b) The total infiltration area shall be defined as follows:

308

309

(i) For standard trenches the total infiltration area shall be calculated based on the following formula:

310

311

$$A = L(W + 2S)$$

312

313

A = Total infiltration area

314

315

L = Total length of trench

316

317

W = Bottom width

318

319

S = Sidewall height of 12 inches or less

320

321

(A) The sidewall height is the depth below the flowline of the pipe to the bottom of the trench.

322

323

324

(B) The maximum credit for sidewall height shall not exceed twelve (12) inches even if the actual sidewall height exceeds twelve inches.

325

326

327

(ii) For chamber trenches, the total infiltration area shall be calculated based on the following formula:

328

329

$$A = L(E + 2S)$$

330

331

A = Total infiltration area

332

333

334 L = Total length of trench

335

336 E = Effective bottom width (Multiply width of the chamber by factor of
337 1.43 to get effective bottom width)

338

339 S = Sidewall height of 12 inches or less

340

341 (A) The factor of 1.43 incorporates a thirty percent (30%) reduction of the
342 bottom area.

343

344 (B) The maximum credit for sidewall height shall not exceed twelve (12)
345 inches even if the actual sidewall height exceeds twelve (12) inches.

346

347 (C) The sidewall height is the height of the slotted sidewall of the
348 chamber or depth below the flow line of the inlet pipe, whichever is less.

349

350 (D) The total length of the trench is the number of chambers in a row
351 multiplied by the length of one piece of chamber.

352

353 (iii) For standard bed systems, the total infiltration area shall be calculated
354 based on the following formula:

355

$$A = LW$$

356

357 A = Total infiltration area

358

359 L = Total length of bed

360

361 W = Width of the bed

362

363 (A) The sidewall credit shall not be used in calculating the total infiltration
364 area for a bed system.

365

366 (iv) For chamber bed systems, the total infiltration area shall be calculated
367 based on the following formula:

368

$$A = L(ExR)$$

369

370 A = Total infiltration area

371

372 L = Total length of bed

373

374 E = Effective bottom width of the chamber (Multiply width of the
375 chamber by factor of 1.43 to get effective bottom width)

376

377 R = Number of chamber rows (Multiply effective bottom width of
378 chamber by number of chamber rows to get effective bottom width of bed.)

379

380
381 (A) The factor of 1.43 incorporates a thirty percent
382 (30%) reduction of the bottom area.

383
384 (B) The total length is the number of chambers in a row
385 multiplied by the length of one piece of chamber.

386
387 (c) Coarse sand or soils having a percolation rate less than one (1) minute per inch
388 (mpi) are unsuitable for subsurface effluent disposal. These soils may be used if a one (1) foot
389 layer of fine sand or loamy sand is placed below the constructed soil absorption system. The soil
390 absorption system shall be sized based on the percolation rate of the fill material.

391
392 **Section 9. Building Sewer Pipes.**

393
394 All building sewers shall be installed in accordance with the 2012 International Plumbing
395 Code (IPC). In the absence of a locally approved plumbing code, and in addition to the IPC, the
396 building sewer shall comply with the following:

397
398 (a) Suitable building sewer pipe materials are polyvinyl chloride (PVC) or
399 acrylonitrile-butadiene-styrene (ABS). The septic tank inlet and outlet pipes shall be schedule
400 40 PVC or ABS pipe and shall span the excavations for the septic tank and/or dosing chamber.
401 American Society for Testing and Materials (ASTM) D-3034 Standard Dimension Ratio (SDR)
402 35 plastic pipe may be used if the void at the tank's side is filled with material that is granular,
403 clean, and compacted.

404
405 (b) Building sewer pipes shall be sized to handle the peak hourly flow from the
406 building and shall not be smaller than four (4) inches in diameter. When two different sizes or
407 types of sewer pipes are to be connected, a proper type of fitting or conversion adapter shall be
408 used.

409
410 (c) Sewer pipe shall not decrease in size flowing downstream.

411
412 (d) Building sewer pipes shall be laid at a standard slope of 1/4 inch per foot, and
413 shall not be flatter than 1/8 inch per foot.

414
415 (e) Cleanouts shall be provided between the structure and the tank, at branch
416 connections, every change in alignment, and at least every 100 feet in straight runs.

417
418 (f) All sewer piping shall be laid on a firm bed throughout its entire length. It shall
419 be protected from damage due to rocks, hard lumps of soil, debris, and the like.

420
421 (g) Special care shall be used to prevent lateral movement or deformation during
422 backfill. The backfill material shall be compacted to a density at least equivalent to the trench
423 walls. Backfill over the pipe shall be of sufficient depth to protect the pipe from expected traffic
424 loads and the wastewater from freezing.

425

426 **Section 10. Septic Tanks and Other Treatment Tanks.**

427
428 (a) Septic Tanks

429
430 (i) Septic tanks shall be fabricated or constructed of concrete, fiberglass,
431 thermoplastic or an approved material. Tanks shall be watertight and fabricated to constitute an
432 individual structure, and shall be designed and constructed to withstand anticipated loads. As
433 part of the application review process, Department of Environmental Quality, Water Quality
434 Division (DEQ/WQD) or the delegated small wastewater program shall review the design of
435 prefabricated septic tanks for compliance with applicable construction standards.

436
437 (ii) The septic tank shall be placed on a level grade and a firm bedding to
438 prevent settling. Where rock or other undesirable protruding obstructions are encountered, the
439 opening for the septic tank shall be over excavated, as needed, and backfilled with sand, crushed
440 stone, or gravel to the proper grade.

441
442 (A) Septic tanks shall not be buried deeper than the tank
443 manufacturer's maximum designed depth for the tank. The minimum depth of soil cover over
444 the top of the tank is six (6) inches.

445
446 (B) Backfill around and over the septic tank shall be placed in such a
447 manner as to prevent undue strain or damage to the tank or connected pipes.

448
449 (C) Septic tanks shall not be placed in areas subject to vehicular traffic
450 unless engineered for the anticipated load.

451
452 (iii) Size

453
454 (A) The minimum liquid volume of a septic tank shall be 1000 gallons
455 for residences up to a four (4) bedroom capacity. Additional capacity of 150 gallons per
456 bedroom shall be provided for each bedroom over four (4).

457
458 (B) Septic tanks for high strength wastewater or non-residential units
459 shall have a minimum effective liquid capacity sufficient to provide at least 48 hour retention at
460 design flow or 1,000 gallons, whichever is greater.

461
462 (iv) Configuration

463
464 (A) Single compartment septic tanks shall have a length to width ratio
465 of no less than two (2) to one (1), or be partitioned to protect against short circuiting flow.

466
467 (B) For septic tanks with two (2) compartments or more, the inlet
468 compartment shall not be less than one-half (1/2) of the total capacity of the tank.

469
470 (C) The liquid depth shall be between three (3) feet and six (6) feet.

471

472 (D) The tank partition shall allow the venting of gases between
473 compartments and out through the vent stack on the plumbing system of the house.
474

475 (E) The inlet and outlet on all tanks or tank compartments shall be
476 provided with open-ended sanitary tees or baffles made of approved materials constructed to
477 distribute flow and retain scum in the tank or compartments.
478

479 (I) The tees or baffles shall extend above the liquid level a
480 minimum distance of five (5) inches.
481

482 (II) The inlet tees or baffles shall extend below the liquid level
483 at least eight (8) inches but no more than 40% of the liquid level. The outlet tees or baffles shall
484 extend below the liquid level at least ten (10) inches but no more than 45% of the liquid level.
485

486 (III) A minimum of one (1) inch of clear space shall be provided
487 over the top of the baffles or tees for venting.
488

489 (IV) The inlet pipe shall be at least two (2) inches higher than
490 the outlet pipe. The outlet elevation shall be designed to provide a minimum distance of nine (9)
491 inches or twenty (20) percent of the liquid depth between the top of the liquid and the bottom of
492 the septic tank cover for scum storage and the venting of gases.
493

494 (v) If additional septic tank capacity over 1,000 gallons is needed, it may be
495 obtained by joining tanks in series provided the following requirements are met:
496

497 (A) The inlet of each successive tank shall be at least two (2) inches
498 lower than the outlet of the preceding tank, and shall have no tee or baffle except for the inlet to
499 the first tank and the outlet for the last tank.
500

501 (B) The first tank or the first compartment of the first tank shall be
502 equal to fifty percent (50%) or larger of the total septic tank system volume.
503

504 (vi) An access opening shall be provided to each compartment of the septic
505 tank for inspection and cleaning.
506

507 (A) The access opening(s) in the cover/lid of the tank shall have a
508 minimum diameter of twenty (20) inches. Both inlet and outlet devices shall be accessible.
509

510 (B) The riser from the access opening shall terminate at a maximum of
511 six (6) inches below the ground surface. Riser covers terminating above grade shall have an
512 approved locking device.

513 (vii) Land application of domestic septage in remote areas that meet the
514 conditions found in Appendix B will be permitted as a permit by rule. Delegated small
515 wastewater programs may issue individual permits.
516

517 (viii) An effluent filter with an opening of 1/8-inch or smaller shall be provided

518 on the outlet of a septic tank or other tank that precedes a small diameter pressure distribution
 519 system.

520
 521 (b) Dosing Tanks

522
 523 (i) Dosing tanks shall meet the same material and installation requirements as
 524 septic tanks. Dosing tanks shall have a minimum 20-inch diameter access opening and it shall
 525 have a riser from the access opening to the ground surface. The following table shall be used to
 526 calculate the size of the dosing tank:

527
 528 **Table 6. Dosing Tank Volume (gallons)**

Average Design Flows (gpd)	0-499	500-999	1000-1499	1500-2000
Between Pump “off” and Tank Inlet	350	700	1000	1300
Between Tank Inlet and Alarm Switch	200	400	600	800
Between Alarm switch and Pump “on”	50	100	100	100
Between Pump “on” and Pump “off”	100	200	300	400
Recommended Pump Capacity (gpm)	10	20	30	40

529
 530 (ii) High water alarms shall be provided for all tanks that use pumps or
 531 siphons. The alarm device shall be an audible alarm or an indoor illuminated alarm or both.

532
 533 (iii) The minimum effluent level shall achieve complete submergence of the
 534 pump.

535
 536 (iv) Dosed systems using a siphon shall have a dose counter installed to check
 537 for continued function of the siphon.

538
 539 (c) Holding Tanks

540
 541 (i) Holding tanks shall meet the same material requirements as septic tanks.
 542 Holding tanks shall have a twenty (20)-inch minimum diameter access opening. A riser shall be
 543 brought to ground surface from the access opening.

544
 545 (ii) Holding tanks shall not be used for residential systems when other
 546 alternative systems are available, except on a temporary, seasonal or intermittent basis, or when
 547 used to correct a failed soil absorption system when other alternatives are unavailable.

548
 549 (iii) Holding tanks must be located in an area readily accessible to the pump
 550 truck and where the tank itself will not float due to high groundwater. If seasonal high
 551 groundwater may be present, the tank shall be properly anchored.

552
 553 (iv) The minimum liquid volume shall be the greater of 1,000 gallons or seven

554 (7) days storage based upon flow rate determined from Section 5.
555

556 (v) All holding tanks shall be equipped with a high-water level alarm. The
557 device shall be an audible alarm or an indoor illuminated alarm or both. The device shall be
558 installed so that the alarm is triggered when the water level reaches 3/4 of the tank capacity.
559

560 (vi) A design package for holding tanks is provided online at the Division's
561 website to assist the applicant in submitting a completed application for coverage under the
562 general permit for small wastewater systems. The worksheet and calculations were prepared by
563 a registered professional engineer employed by the Wyoming Department of Environmental
564 Quality, Water Quality Division. The general design requirements stated in this section are
565 incorporated into the worksheets such that by properly completing the forms and installing the
566 components, the system will comply with these requirements.
567

568 (d) Grease Interceptors
569

570 (i) A commercial or institutional food preparation facility with a waste stream
571 containing fat, oil, and grease (FOG) in excess of 25 mg/L shall install an exterior grease
572 interceptor or a device approved by the delegated health department or county. Facilities that
573 typically have waste streams high in FOG are, but not limited to, restaurants, cafeterias,
574 slaughterhouses, and institutional kitchens.
575

576 (ii) Waste streams high in FOG shall be plumbed separately and directly to a
577 grease interceptor prior to the waste treatment process.
578

579 (iii) Waste streams from sanitary facilities such as bathrooms, toilets, urinals,
580 or other similar fixtures shall not be discharged into the grease interceptor. These sources must
581 be connected at least four to six (4-6) feet downstream of the grease interceptor's discharge. The
582 design shall prevent any backflow from the sanitary sources into the grease interceptor.
583

584 (iv) Only one source facility per grease interceptor shall be allowed.
585

586 (v) Grease interceptors shall be located so that they are easily accessible for
587 inspection, cleaning, and removal of the collected wastes. The interceptor shall not be closer
588 than fifteen (15) feet from the last discharging fixture and no further away than thirty-five (35)
589 feet.
590

591 (vi) Grease interceptors shall have at least two (2) compartments with a 20-
592 inch minimum diameter access opening for each compartment for cleanout. Each access opening
593 shall have a riser brought to the surface and have a sealed lid that is rated for any anticipated
594 load. There shall be a means provided to sample the effluent.
595

596 (vii) There shall be no internal cleanout tees or bypasses.
597

597 (viii) The inlet and outlet of the grease interceptor shall be vented. The vent
598 pipe shall be at least two (2) inches in diameter. The inlet and outlet vents shall not be
599 interconnected.

600
 601 (ix) The outlet pipe invert shall be no more than two (2) inches lower than the
 602 inlet invert.

603
 604 (x) The dividing wall between compartments shall be the same height as the
 605 other walls and the cover should contact the top of the dividing wall. If the partition/dividing
 606 wall does not contact the cover, the outlet tee or baffle shall extend below the liquid level, 40-
 607 50% of the total liquid depth.

608
 609 (xi) The effluent from each compartment shall be drawn from the bottom of a
 610 riser pipe that terminates at least eighteen (18) inches below the inlet pipe invert of that same
 611 compartment.

612
 613 (xii) Grease interceptors shall be accessible during normal business hours
 614 without interrupting normal business operations.

615
 616 (xiii) Grease interceptors shall be installed in accordance with the
 617 manufacturer’s instructions and applicable requirements of this section. A copy of the
 618 manufacturer’s instructions shall be submitted with every permit to construct application
 619 submitted to DEQ/WQD.

620 (xiv) Grease interceptors shall be sized according to the following:

621 Kitchens (grease, garbage)

Number of meals per peak hour	X	Waste Flow rate*	X	Retention time**	X	Storage factor***	=	Interceptor size (liquid capacity)
-------------------------------	---	------------------	---	------------------	---	-------------------	---	------------------------------------

624 *Waste flow rate – see Table 2.

625 **Retention times

Kitchen waste:	
Dishwasher and/or disposal	2.5 hours
Single service kitchen:	
Single serving with disposal	1.5 hours

626 ***Storage factors

Fully equipped commercial kitchen	8 hr. operation: 1 16 hr. operation: 2 24 hr. operation: 3
Single service kitchen:	1.5

627
 628 (A) The minimum interceptor size (liquid capacity) shall be 750 gallons.

629
 630 (e) Other Interceptors

631
 632 (i) Interceptors are required for oil, grease, sand, and other substances
 633 harmful or hazardous to the building drainage system, or the small wastewater treatment system.
 634

635 (A) Laundries

636

637 (I) Commercial laundries, laundromats, and dry-cleaners shall
 638 be equipped with an interceptor in order to reduce the quantity of lint and silt that enter the
 639 collection system.

640

641 (II) The system must be of adequate size and design to allow
 642 for cool-down of wastewater so that separation can be more readily achieved.

643

644 (III) The interceptor shall be installed with a wire basket or
 645 similar device. The wire basket or similar device shall be removable for cleaning and shall
 646 prevent passage into the drainage system of solids 1/2 inch (12.7 mm) or larger in size, such as
 647 string, rags, buttons, or other materials that are detrimental to the waste treatment system.

648

649 (IV) Sizing must be in accordance with the following formula:

650

651 Laundries (grease, lint, silt)

652

Total gallons per cycle	X	Cycles per hour	X	Retention time*	X	Storage factor**	=	Interceptor
-------------------------	---	-----------------	---	-----------------	---	------------------	---	-------------

653

654 *Retention times

Institutional laundries	2.5 hours
Standard commercial laundry	2.0 hours
Light commercial laundry	1.5 hours

655

656 **Storage factors

8 hours of operation	1.0
12 or more hours of operation	1.5

657

(B) Car Washes

658

659 (I) Where automobiles are washed (including detail shops
 660 using hand-wash practices), separators shall have a minimum capacity of 1000 gallons for the
 661 first bay, with an additional 500 gallons of capacity for every other bay.

662

663 (II) Additionally, wash racks must be constructed to eliminate
 664 or minimize the impact of run-off from rain/storm events. Minimum requirements are roofed
 665 structures with at least two walls and appropriate grading to prevent stormwater infiltration into
 666 the sanitary sewer.

667

668 (III) An effluent sampling point is required.

669

(f) Abandonment of Septic and Holding Tanks

670

671 The following is the procedure to abandon septic tanks and holding tanks when the system is
 672 upgraded, equipment replacement is necessary, or central sewer lines are made available:
 673

674
675 (i) The abandoned tank should be pumped and the septage hauled to a
676 licensed facility approved to receive the waste or the septage pumped into the newly constructed
677 septic or holding tank. Discharging to a central sewer requires coordination with, and the
678 approval of, the owner/operator of the sewer system.

679
680 (ii) Once the abandoned tank is empty, it should be removed and the
681 excavation backfilled. As an alternative to removing the tank, the access covers can be removed;
682 the bottom drilled or broken up sufficient to drain; and the tank filled with native soil, pit run, or
683 sand.

684
685 (iii) If the abandoned tank is part of a Class V UIC facility, the abandonment
686 must also be in compliance with Chapter 27, Section 17.

687

688 **Section 11. Effluent Distribution Devices.**

689

690 Distribution boxes and flow divider tees are suitable for level or nearly level ground and
691 are installed before the soil absorption system with the goal of splitting flows equally between
692 soil absorption system laterals. Drop boxes are suitable for sloping ground and are installed to
693 achieve serial loading.

694

695 (a) Distribution Boxes

696

697 (i) The distribution box shall be installed on a level, stable base to prevent
698 tilting or settling, and to minimize movement from frost heave.

699

700 (ii) Boxes shall be watertight and constructed of concrete or other durable
701 material.

702

703 (iii) Boxes shall be designed to accommodate the inlet pipe and the necessary
704 distribution lines. The inlet piping to the distribution box shall be at least one (1) inch above the
705 outlet pipes and all pipes shall have a watertight connection to the distribution box.

706

707 (iv) The box shall be protected against freezing and made accessible for
708 observation and maintenance.

709

710 (v) Boxes shall have flow equalizers installed on each outflow.

711

712 (b) Flow divider tees may be used in place of distribution boxes.

713

714 (c) Drop boxes are suitable for sloping ground and are installed to achieve serial
715 loading. The drop boxes shall meet the requirements in paragraphs (a)(i through v) of this
716 section.

717

718 **Section 12. Standard Soil Absorption Systems.**

719

720 (a) General Design Requirements:

721

722 (i) All soil absorption systems shall be designed in such a manner that the
723 effluent is effectively filtered and retained below the ground surface. The absorption surface
724 accepts, treats, and disperses wastewater as it percolates through the soil.

725

726 (ii) Soil absorption systems shall not be excavated when the soil is wet enough
727 to smear or compact easily. Open soil absorption system excavations shall be protected from
728 surface runoff to prevent the entrance of silt and debris. All smeared or compacted surfaces shall
729 be raked to a depth of one (1) inch, and loose material removed before filter or filler material is
730 placed in the soil absorption system excavation.

731

732 (iii) Soil absorption systems shall be designed to approximately follow the
733 ground surface contours so that variation in excavation depths will be minimized. The trenches
734 may be installed at different elevations, but the bottom of each individual trench shall be level
735 throughout its length.

736

737 (iv) Shallow soil absorption system depths are encouraged to promote
738 treatment and evapotranspiration. The minimum soil cover depth over the soil absorption system
739 is one (1) foot. The maximum depth to the bottom absorption surface of a soil absorption system
740 is five (5) feet. Finished grading shall prevent ponding and promote surface water runoff.

741

742 (v) Pipes, chambers or other products shall be bedded on firm, stable material.
743 Heavy equipment shall not be driven in or over soil absorption systems during construction or
744 backfilling.

745

746 (vi) Standard trenches refer to perforated pipe embedded in aggregate-filled
747 trenches that shall conform to the following:

748

749 (A) The perforated pipe shall have a minimum diameter of 4 inches.
750 Suitable pipe materials include: ASTM D-2729-11 PVC, ASTM D-3034-08 PVC, Schedule 40
751 PVC ASTM d1784-11, and ASTM F810-07 PE.

752

753 (B) The aggregate shall be crushed rock, gravel or other acceptable,
754 durable and inert material that is free of fines, and has an effective diameter between ½ inch and
755 2- ½ inches.

756

757 (C) Prior to backfilling, the aggregate shall be covered throughout with
758 a woven/non-woven geotextile material or a three (3) inch layer of straw.

759

760 (D) Aggregate shall extend the full width and length of the soil
761 absorption system to a depth of at least twelve (12) inches with at least six (6) inches of drain
762 gravel under the distribution pipe and at least two (2) inches over the distribution pipe.

763

764 (E) Maximum width of trench excavation is three (3) feet.

765

766 (F) Minimum spacing of trenches (wall to wall) is three (3) feet.

766 Trench spacing shall be increased to nine (9) feet when the area between each trench is
767 considered as reserve area. For clay loam soils that have percolation rates greater than 60 min/in.,
768 the nine (9) foot spacing shall also be required but it is not considered as reserve area.

769

770 (vii) Standard beds shall conform to the same pipe and aggregate requirements
771 for trenches as found in subparagraphs (vi)(A through D) of this section. Standard beds shall
772 also conform to the following:

773

774 (A) The soils shall have percolation rates less than 60 minutes per inch
775 (5-60 mpi). The bottom of the bed must be level, therefore the site shall be relatively flat,
776 sloping no more than one (1) foot from the highest to the lowest point in the installation area.

777

778 (B) Distribution laterals within a bed must be spaced on not greater
779 than six (6) feet centers. Sidewalls shall not be more than three (3) feet from a distribution
780 lateral.

781

782 (C) Beds must not be wider than twenty-five (25) feet if gravity
783 distribution is used. Multiple beds must be spaced at one-half the bed width.

784

785 (D) Rubber tired vehicles must not be driven on the bottom surface of
786 any bed excavation.

787

788 (viii) Chambered trenches, when used in lieu of perforated pipe and aggregate,
789 shall be installed in conformance with the manufacturer recommendations. No cracked,
790 weakened, modified, or otherwise damaged chamber units shall be used in any installation.

791

792 (A) All chambers shall be an open, arch-shaped structure of durable,
793 non-degradable design, suitable for distribution of effluent without filter material.

794

795 (B) All chamber endplates shall be designed so that the bottom
796 elevation of the inlet pipe is at least six (6) inches from the bottom of the chamber.

797

798 (C) Inlet and outlet effluent sewer pipes shall enter and exit the
799 chamber endplates. Inspection ports shall be installed at all outlet effluent sewer pipes.

800

801 (D) All chambers shall have a splash plate under the inlet pipe or
802 another design feature to avoid unnecessary channeling into the trench bottom.

803

804 (E) The maximum width of the bottom absorption surface for a
805 chambered trench is three (3) feet. The excavation to install a chambered trench may exceed
806 three (3) feet.

807

808 (F) Minimum spacing of trenches (wall to wall) is three (3) feet.
809 Trench spacing shall be increased to nine (9) feet when the area between each trench is
810 considered as reserve area. For clay loam soils that have percolation rates greater than 60 min/in.,
811 the nine (9) foot spacing shall also be required but it is not considered as reserve area.

812

813 (ix) Chambered beds shall conform to the same requirements for chambered
 814 trenches as found in subparagraphs (viii)(A through D) of this section. Aggregate, as specified
 815 in subparagraph (vi)(B) of this section, or native soil shall be used to fill the space between the
 816 chambers.

817

818 (x) Serial Sidehill Trench:

819

820 (A) A minimum of six (6) feet of undisturbed soil shall be maintained
 821 between adjacent trench or bed side walls.

822

823 (B) The bottom of each serial trench or bed system shall be level.

824

825 (C) The overflow pipe between serial soil absorption systems shall be
 826 set no higher than the mid-point of the upstream distribution pipe. The overflow pipe shall not
 827 be perforated.

828

829 (b) A design package for standard soil absorption systems is provided online at the
 830 Division's website to assist the applicant in submitting a completed application for coverage
 831 under the general permit for small wastewater systems. The worksheet and calculations were
 832 prepared by a registered professional engineer employed by the Wyoming Department of
 833 Environmental Quality, Water Quality Division. The general design requirements stated in this
 834 section are incorporated into the worksheets such that by properly completing the forms and
 835 installing the components, the system will comply with these requirements.

836

837 **Section 13. Pressure Distribution Systems.**

838

839 (a) General Design Requirements:

840

841 (i) The basic elements of a pressure distribution system include a dosing tank,
 842 filter, and a means to deliver specified doses to a small diameter pipe network within a soil
 843 absorption system. Pressure distribution is required for mound systems or for bed systems with a
 844 width greater than twenty-five (25) feet.

845

846 (ii) Pumps must be sized to match the distribution system curve or demand.
 847 Pumps shall be designed for sewage pumping applications and be accessible from the ground
 848 surface.

849

850 (iii) The control system for the pump and dosing tank shall, at a minimum,
 851 consist of a "pump off" switch, a "pump on" switch, and a "high liquid alarm".

852

853 (A) All electrical connections must be made outside of the chamber in
 854 either an approved weatherproof box or an explosion-proof junction box.

855

856 (B) The wiring from the junction box to the control box must pass
 857 through a sealing fitting to prevent corrosive gases from entering the control panel.

903

(C) All wires must be contained in solid conduit from the dosing chamber to the control box.

(iv) The pressure transport piping between the tank and the soil absorption system shall be designed to prevent freezing.

(A) The ends of lateral piping shall be constructed with long sweep elbows or an equivalent method to bring the end of the pipe to finished grade. The ends of the pipe shall be provided with threaded plugs, caps, or other devices to allow for access and flushing of the lateral.

(B) All joints in the manifold, lateral piping, and fittings shall be solvent-welded using the appropriate joint compound for the pipe material. Pressure transport piping may be solvent-welded or flexible gasket jointed.

(C) Where automatic siphons or other devices are used, they shall be designed to empty the dosing tank in less than ten (10) minutes.

(v) The pressure distribution system shall have a combination of at least three (3) vertical feet of filter sand and/or unsaturated native soil above the high groundwater level. The filter sand shall conform to ASTM C-33, with less than 2% passing the #200 sieve.

(b) A design package for pressure distribution systems is provided online at the Division's website to assist the applicant in submitting a completed application for coverage under the general permit for small wastewater systems. The worksheet and calculations were prepared by a registered professional engineer employed by the Wyoming Department of Environmental Quality, Water Quality Division. The general design requirements stated in this section are incorporated into the worksheets such that by properly completing the forms and installing the components, the system will comply with these requirements.

Section 14. Sand Mound Systems.

The sand mound consists of a sand fill, an aggregate bed and a soil cap.

(a) Selection Criteria:

The high groundwater level, bedrock, or impervious clay layer is less than four (4) feet below the bottom of the soil absorption system excavation.

(b) Site Requirements:

(i) A minimum of one (1) foot of vertical separation of the native soil is required between the bottom of the sand fill and the top of the high groundwater level, any restrictive layer, or any highly permeable material.

904 (ii) The percolation rate of the native soil at the interface of the sand fill shall
905 be greater than five (5) and less than sixty (60) minutes per inch (5-60 mpi). The percolation
906 shall be measured in the top twelve (12) inches of native soil.

907
908 (c) General Design Requirements:

909
910 (i) Sand Layer

911
912 (A) Filter sand shall conform to ASTM C-33, with less than two
913 percent (2%) passing through the #200 sieve.

914
915 (B) The minimum depth of sand below the aggregate bed surface shall
916 be one (1) foot.

917
918 (C) The sand mound shall have a combination of at least four (4)
919 vertical feet of filter sand and unsaturated native soil above the high groundwater level.

920
921 (I) For sand mounds using pressure distribution systems, the
922 depth to high groundwater shall be three (3) feet below the bottom of the absorption surface if
923 the percolation rate of the soil is five (5) minutes per inch or greater (5-60 mpi).

924
925 (D) The top of the sand layer under the aggregate bed shall be level in
926 all directions.

927
928 (E) The sand layer shall fill around the perimeter of and to the top of
929 the aggregate bed.

930
931 (F) The slope of all sides shall be three (3) horizontal to one (1)
932 vertical or flatter. The side slopes shall be graded to prevent seepage and/or ponding at the
933 bottom of the slope.

934
935 (G) The infiltration area, which is the bottom of the sand fill, shall be
936 calculated by dividing the design flowrates (gpd) from Table 1 or Table 2 by the loading rate
937 (gpd/ft²) found in Table 5.

938
939 (ii) Aggregate Bed

940
941 (A) The aggregate shall be crushed rock, gravel or other acceptable,
942 durable and inert material that is free from fines, and has an effective diameter between one-half
943 (1/2) inch and two and one half (2 1/2) inch.

944
945 (B) The aggregate bed depth shall not be less than nine (9) inches with
946 a minimum of six (6) inches of clean aggregate placed below the distribution pipe and two (2)
947 inches above the distribution pipe. The aggregate shall be covered with an approved geotextile
948 material after installation and testing of the pressure distribution system.

949

950 (C) The design shall be a long, narrow bed design with a maximum
951 width of twenty-five (25) feet.

952
953 (D) The infiltration area, which is the bottom of the aggregate bed,
954 shall be calculated by dividing the design flowrates (gpd) from Table 1 and Table 2 by the
955 loading rate of 0.8 gpd/ft².

956
957 (iii) Soil Cover

958
959 (A) The soil cap shall be constructed of a sandy loam, loamy sand, or
960 silt loam. The depth of the soil cap shall be at least six (6) inches at the edges to twelve (12)
961 inches at the center. The slope of all sides shall be three (3) horizontal to one (1) vertical or
962 flatter.

963 (B) A layer of top soil at least six (6) inches thick shall be placed over
964 the entire sand mound area. The sand mound should be planted with vegetation that does not
965 require watering and will not establish deep roots. Native grasses are commonly used.

966
967 (d) A design package for sand mound systems is provided online at the Division's
968 website to assist the applicant in submitting a completed application for coverage under the
969 general permit for small wastewater systems. The worksheet and calculations were prepared by
970 a registered professional engineer employed by the Wyoming Department of Environmental
971 Quality, Water Quality Division. The general design requirements stated in this section are
972 incorporated into the worksheets such that by properly completing the forms and installing the
973 components, the system will comply with these requirements.

974
975 **Section 15. Small Wastewater Lagoons.**

976
977 (a) Selection Criteria:

978
979 (i) Lagoons shall only be considered in areas of Wyoming where the annual
980 evaporation exceeds the annual precipitation during the active use of the lagoon.

981
982 (ii) Lagoons shall only be allowed when the percolation rate exceeds sixty
983 (60) minutes per inch and the soil extends vertically down at least two (2) feet from the bottom
984 of the lagoon to the seasonal high groundwater table or bedrock formations.

985
986 (iii) A lagoon shall not be constructed within the 100 year floodplain.

987
988 (b) General Design Requirements:

989
990 (i) Beyond the horizontal setback distances requirements specified in Section
991 7(g) of this rule, the lagoon shall not be placed within one hundred (100) feet of the owner's
992 property line.

993
994 (ii) The use of a septic tank that meets the specifications in Section 9 of this
995 rule shall be required before the small wastewater lagoon.

- 996
- 997 (iii) The lagoon shall be located and constructed so it will not receive surface
- 998 runoff water.
- 999 (iv) The slope of the lagoon site shall not exceed five percent (5%).
- 1000
- 1001 (v) The lagoon site must be located in an area of maximum exposure to sun
- 1002 and wind.
- 1003
- 1004 (vi) The lagoon shall be designed for complete retention.
- 1005
- 1006 (vii) The area of the lagoon shall be calculated based on the following formula.

1007
$$A = \frac{584 \times Q}{(365 \times S) + (E - P)}$$

1008

1009 $A =$ Area of the lagoon (in square feet) at the maximum operating depth of five (5)

1010 feet.

1011

1012 $Q =$ Average daily sewage flow, gallons per day. (Multiply values from Table 1 or 2

1013 by 0.6 to get average daily flow.)

1014

1015 $E =$ Average annual lake evaporation in inches per year. (Note: lake evaporation is

1016 less than pan evaporation; lake evaporation equals pan evaporation times a pan coefficient of

1017 0.7)

1018

1019 $P =$ Average annual precipitation rate in inches per year.

1020

1021 $S =$ Seepage rate in decimal form, in inches per day.

1022

1023 (viii) The slopes of the dikes shall not be steeper than three (3) horizontal to one

1024 (1) vertical. The minimum width of the top of the dike shall be four (4) feet.

1025

1026 (ix) All fill shall consist of impervious material that is well compacted and free

1027 of rocks, frozen soil, or other large material.

1028

1029 (x) The minimum operating depth shall be two (2) feet. The dikes shall

1030 provide a minimum freeboard of two (2) feet.

1031

1032 (xi) The floor of the lagoon shall be level and maintained free of all vegetation.

1033

1034 (xii) The influent line into the lagoon must discharge near the center.

1035

1036 (xiii) A cleanout, with a tightly fitting cap, or manhole shall be provided in the

1037 influent line near the dike.

1038

1039 (xiv) The area around the small wastewater lagoon shall be fenced to preclude

1040 the entrance of livestock, pets, and humans. The fence shall be equipped with a locking gate.
1041 The gate shall have a sign indicating “NO TRESPASSING – WASTEWATER LAGOON”.

1042
1043 (c) A design package for a small wastewater lagoons is provided online at the
1044 Division’s website to assist the applicant in submitting a completed application for coverage
1045 under the general permit for small wastewater systems. The worksheet and calculations were
1046 prepared by a registered professional engineer employed by the Wyoming Department of
1047 Environmental Quality, Water Quality Division. The general design requirements stated in this
1048 section are incorporated into the worksheets such that by properly completing the forms and
1049 installing the components, the system will comply with these requirements.

1050

1051 **Section 16. Privies or Outhouses.**

1052

1053 Privies or outhouses that meet the requirements of this section are permitted by rule. A
1054 permit by rule requires the owner to submit the information contained in paragraph (g) of this
1055 section to the Wyoming Department of Environmental Quality, Water Quality Division prior to
1056 constructing or installing the facility. By submission of the required information, the owner
1057 acknowledges and certifies they will comply with the requirements contained in this section.

1058

1059 Pre-fabricated privies or outhouses shall be sealed, water-tight vaults and shall meet the
1060 following conditions:

1061

1062 (a) The horizontal setback distance requirements for sealed privies or outhouses shall
1063 comply with Section 7(g) for septic tanks.

1064

1065 (b) The depth to seasonally high groundwater from the bottom of a water tight vault
1066 shall be sufficient to prevent floatation of the empty vault.

1067

1068 (c) The vault must have sufficient capacity for the dwelling served, and must have at
1069 least 27 cubic feet or 200 gallons of capacity.

1070

1071 (d) Privies or outhouses must be insect tight; must have a self-closing door; the privy
1072 or outhouse seat must include a cover; and all exterior openings, including vent openings, shall
1073 be screened.

1074

1075 (e) Privies or outhouses must be adequately vented.

1076

1077 (f) Privies or outhouses shall not be constructed within the 100 year floodplain.

1078

1079 (g) Owner’s name, address, phone number, legal description of privy or outhouse
1080 (address, latitude/longitude, or ¼ ¼ section), and the date construction or installation will begin.

1081

1082 **Section 17. Greywater Systems.**

1083

1084 Greywater systems that meet the requirements of this section are permitted by rule. A
1085 permit by rule requires the owner to submit the information contained in paragraph (e) of this

1086 section to the Wyoming Department of Environmental Quality, Water Quality Division prior to
1087 constructing, modifying, or installing the system. By submission of the required information, the
1088 owner acknowledges and certifies they will comply with the requirements contained in this
1089 section.

1090 (a) Greywater Operation and Requirements

1092 (i) Restrictions

1094 (A) Greywater shall not leave the property on which it is
1095 generated. Ponding or runoff is prohibited.

1097 (B) Greywater systems shall not be installed in a delineated
1098 floodplain.

1100 (C) The volume of greywater shall not exceed an average of
1101 2000 gallons per day.

1103 (D) Greywater shall not come in direct contact with or
1104 adversely impact surface or groundwater.

1106 (E) Food crops for direct human consumption should not be
1107 harvested for 30 days after application of greywater.

1109 (ii) Odor control of the greywater system shall meet the requirement
1110 of Wyoming DEQ Air Quality Regulations Chapter 2, Section 11.

1112 (iii) If the greywater system is to be used during the winter, the
1113 greywater system shall be designed to prevent freezing.

1114 (b) Estimating Greywater Discharge

1116 (i) The greywater discharge for single family and multi-family dwellings
1117 shall be calculated by estimates of greywater use based on water use records, or the following
1118 procedure:

1119 (A) The number of occupants of each dwelling unit shall be calculated
1120 as 2 occupants per bedroom.

1121 (B) The estimated greywater flows of each occupant shall be
1122 calculated in gallons per day (gpd) as follows:

1123 Showers, bathtubs and wash basins – 25 gpd/occupant

1124 Laundry – 15 gpd/occupant

1132 (ii) The total number of occupants shall be multiplied by the applicable
1133 estimated greywater discharge as provided above and the type of fixtures connected to the
1134 greywater system.

1135
1136 (c) Greywater System Configurations

1137
1138 (i) All greywater systems shall have means to direct greywater to
1139 either the blackwater system or the greywater system.

1140
1141 (ii) Diverter valves shall not have the potential to allow backflow from
1142 the blackwater system into the greywater system.

1143
1144 (iii) Greywater used for surface irrigation should be disinfected. The
1145 disinfection should achieve a fecal coliform level of 200 cfu/100 mL or less.

1146
1147 (d) Setbacks

1148
1149 (i) A 30 foot buffer zone is required between the greywater
1150 application site and adjacent property lines and any public right-of-way.

1151
1152 (ii) A 30 foot separation distance is required between greywater
1153 application sites and all surface waters.

1154
1155 (iii) A 100 foot separation distance is required between greywater
1156 application sites and all potable water supply wells.

1157
1158 (e) Owner's name, address, phone number, legal description of greywater system
1159 (address, latitude/longitude, or ¼ ¼ section), and the date construction or installation will begin.

1160
1161 **Section 18. Operation and Maintenance.**

1162
1163 (a) For any system that disposes of wastewater through land application or subsurface
1164 filtration, the owner shall not add any chemical or biochemical additive to the system that would
1165 adversely affect the quality of the groundwater as stated in the WDEQ Water Quality Rules &
1166 Regulations, Chapter 8.

1167
1168 (b) Septic tanks shall be pumped as needed to prevent solids carryover into the soil
1169 absorption system.

1170
1171 (c) Holding tanks and sealed vaults shall be pumped prior to reaching their maximum
1172 capacity.

1173
1174 (d) Any service provider that pumps septic tanks, holding tanks, or sealed vaults,
1175 shall dispose of the wastewater contents at a permitted wastewater treatment facility or in a
1176 manner approved by the Division or delegated authority.

1177

1178 (e) Damaged fittings and broken, crushed or plugged piping associated with any
 1179 small wastewater system shall be replaced in a timely manner.

1181 (f) Composting or non-discharging toilets, where permitted, shall have their waste
 1182 disposed of at a permitted wastewater treatment facility or landfill, or in a manner approved by
 1183 the Division or delegated authority.

1184
 1185 **Section 19. Commercial and Industrial Wastes and/or Domestic Wastes Greater**
 1186 **Than 2000 Gallons per Day.**

1187
 1188 (a) Commercial/industrial wastewater systems or combination commercial/industrial
 1189 and domestic wastewater systems are subject to applicable requirements listed in sections 1
 1190 through 15 of this chapter, in addition to requirements in this section.

1191
 1192 (b) If the wastewater is classified as, or determined to be hazardous, toxic, and/or
 1193 contain petroleum products, the applicant shall demonstrate to the Administrator that any
 1194 discharge or seepage from the wastewater facility will not cause a violation of the surface and/or
 1195 groundwaters of the state in accordance with Chapter 1, “Quality Standards for Wyoming
 1196 Surface Waters” and Chapter 8, “Quality Standards for Wyoming Groundwaters.”

1197
 1198 (c) If the impact of the hazardous, toxic, and/or petroleum products cannot be
 1199 determined and mitigated, disposal of the wastewater using a soil absorption system shall be
 1200 prohibited.

1201
 1202 (d) Pre-treatment of the wastewater to remove the hazardous, toxic, and/or petroleum
 1203 products shall be required prior to disposal if deemed necessary to protect the Groundwater(s)
 1204 and Surface Water(s) of the State.

1205
 1206 (e) The minimum horizontal setback distances (in feet) shown in Table 7 shall be
 1207 maintained for commercial and industrial wastes and/or wastes greater than 2000 gallons per day
 1208 but less than 10,000 gallons per day.

1209
 1210 **Table 7. Minimum Horizontal Setbacks for Commercial and Industrial Wastes in Feet¹**

From	To Septic Tank Or Equivalent	To Absorption System
Wells (includes neighboring wells)	50	200
Public Water Supply Well	100	500 ²
Property Lines	10	10
Foundation Wall (w/o drains)	5	10
Foundation Wall (with drains)	5	50
Potable Water Pipes	25	50

From	To Septic Tank Or Equivalent	To Absorption System
Septic Tank	N/A	10
Surface Water, Spring (including seasonal and intermittent)	50	100
Cisterns	50	50

1211 ¹ For systems larger than 10,000 gallons per day, the isolation distance shall be determined by a
 1212 hydrogeological study in accordance with Section 17(b) of Chapter 3, but shall not be less than
 1213 those shown in Table 7.
 1214

1215 ² Wastewater systems that discharge to the same aquifer that supplies a public water supply well
 1216 and are located within Zone 1 or 2 (Attenuation) of the public water supply well, as determined
 1217 by *Wyoming Department of Environmental Quality Source Water Assessment Project (2004)* or
 1218 as established in Section 2 of the *Wyoming Wellhead Protection Guidance Document (1997)*,
 1219 shall provide additional treatment. These systems will be required to obtain an individual permit
 1220 to construct and will require that a PE sign, stamp, and date the application, as stated in Section 2
 1221 of this chapter. The additional treatment shall be in accordance with Chapter 3, Section 2(b)(ii).
 1222 The treatment shall reduce the nitrates to less than 10 mg/L of NO₃- as N and provide 4-log
 1223 removal of pathogens before the discharge leaves the property boundary of each small
 1224 wastewater system.

1267
1268
1269
1270

Section 1. Purpose

(a) Percolation tests are used to determine absorption system site suitability and to size the absorption system.

Section 2. Procedure

(a) General Requirements:

(i) Percolation tests shall not be conducted in test holes that extend into groundwater, bedrock, or frozen ground.

(ii) The percolation test shall be conducted only after the soil exploration pit has been dug and examined.

(iii) A minimum of three (3) percolation test holes are required.

(iv) The percolation test holes shall be spaced uniformly over the proposed soil absorption system site.

(b) Preparation

(i) A twelve (12) inch diameter hole shall be dug or bored to the proposed depth of the soil absorption system.

(ii) The walls shall be vertical, with the natural soil surface exposed without smearing.

(iii) The sides and bottom shall be scarified with a sharp pointed instrument and the loose material shall be removed from the hole.

(iv) Two (2) inches of gravel or coarse sand shall be placed in the bottom of the hole to prevent it from scouring and sealing during water addition.

(c) Presoaking

(i) The purpose of presoaking is to have the water conditions in the soil reach a stable condition similar to that which exists during continual wastewater application. The minimum time of presoaking varies with soil conditions but must be sufficiently long so that the water seeps away at a constant rate. The following presoaking instructions are usually sufficient to obtain a constant rate.

(A) Fill each hole with clear water to a level at least eighteen (18) inches above the gravel or coarse sand. If the eighteen (18) inches of water seeps away in

1271 eighteen (18) minutes or less, add eighteen (18) inches of water a second time. If the second
 1272 filling of eighteen (18) inches of water seeps away in eighteen (18) minutes or less, this indicates
 1273 the soil is sandy and is excessively permeable. The soil absorption system shall meet the
 1274 requirements of Section 8 (c).

1275
 1276 (B) If either the first or second fillings of eighteen (18) inches of water
 1277 does not seep away in ninety (90) minutes, eighteen (18) inches of water must be maintained in
 1278 the hole for at least four (4) hours to presoak the test hole. After the four (4) hours of water
 1279 contact time, wait at least twelve (12) hours before starting the percolation rate measurement.

1280
 1281 (d) Percolation Rate Measurement

1282
 1283 (i) Fill each test hole with twelve (12) inches of water and allow the soil to
 1284 rehydrate for fifteen (15) minutes prior to any measurements.

1285
 1286 (ii) Establish a fixed reference point to measure the incremental water level
 1287 drop at constant time intervals. The water level drop should be measured to the nearest 1/8 of an
 1288 inch and the minimum time interval is ten (10) minutes.

1289
 1290 (iii) Refill the test hole to twelve (12) inches above the gravel before starting
 1291 the measurements. Continue to measure the incremental water level drop at a constant time
 1292 interval until a consistent incremental water level drop is achieved. A consistent water level drop
 1293 is achieved when three (3) consecutive water level drops are within 1/8 inches of each other.

1294
 1295 (iv) Before the water level drops below one (1) inch above the gravel, refill the
 1296 test hole to twelve (12) inches and continue to measure the incremental water level drop.

1297
 1298 (v) The percolation rate is calculated for each hole using the following
 1299 formula:

$$\frac{\text{Time Interval (Minutes)}}{\text{Final Water Level Drop (inches)}} = \text{Percolation Rate (minutes/inch)}$$

1300
 1301 (vi) If only three to five percolation tests are performed, the design percolation
 1302 rate for the absorption system is the largest rate from all the holes tested. If six or more
 1303 percolation tests are performed, the design percolation rate for the absorption system is the
 1304 average of all the holes tested as determined by the above formula.

1305 (e) The following information shall be recorded:

- 1306 (i) Date(s) of test(s);
- 1307 (ii) Location, diameter, and depth of each test hole;
- 1308 (iii) Duration of presoak;
- 1309 (iv) Time of day for beginning and end of each water-level drop interval;
- 1310
- 1311
- 1312
- 1313

- 1314 (v) Each water-level drop measurement;
- 1315
- 1316 (vi) Calculated percolation rate;
- 1317
- 1318 (vii) Name and signature of person performing test;
- 1319
- 1320 (viii) Name of owner or project name; and
- 1321
- 1322 (ix) Certification that the percolation test was done in accordance with
- 1323 Wyoming Water Quality Rules and Regulations Chapter 25 Appendix A.
- 1324

APPENDIX B Land Application of Domestic Septage in Remote Areas

Section 1. Restrictions and Requirements

To qualify for the land application of domestic septage in remote areas, the following conditions must be met:

(a) Location restrictions:

(i) Domestic septage generated on a specific property may be land applied on said property, and shall not be transported to another location for land application.

(ii) No land application of domestic septage shall occur within 1,000 feet of all adjacent properties.

(iii) No land application of domestic septage shall occur within 300 feet of a public road, permanent surface water body, or intermittent stream.

(b) Site restrictions:

(i) The land application of domestic septage shall only occur on those sites with established vegetation such as rangeland, pasture or hay meadows.

(ii) No more than 5,000 gallons of domestic septage per acre per year shall be land applied.

(iii) No land application of domestic septage shall occur where the site's slope exceeds five percent (5%) or where the depth to groundwater is less than four (4) feet.

(iv) The land application of domestic septage shall not occur between November 1 and May 1, or any other time when frozen or saturated ground conditions exists.

(v) No public access shall be allowed to any site where domestic septage has been applied for at least one (1) year following application.

(vi) No grazing animals shall be allowed access to any site where domestic septage has been land applied for at least thirty (30) days following application.

(c) Crop restrictions:

(i) No root crops shall be harvested from soils where domestic septage has been land applied for at least thirty-eight (38) months following application

(ii) No truck crops (harvested parts touch land surface) shall be harvested from soils where domestic septage has been land applied for at least fourteen (14) months following application.

1371 (iii) No commodity crops (other food, feed, and fiber crops whose harvested
1372 parts do not touch land surface) from soils where domestic septage has been land applied shall be
1373 harvested for at least thirty (30) days following application.

1374
1375 (iv) No turf shall be harvested from soils where domestic septage has been
1376 land applied for at least one (1) year following application.

1377
1378 (d) Reporting Requirements:

1379
1380 (i) The property owner shall notify the appropriate Department of
1381 Environmental Quality, Water Quality Division (DEQ/WQD) District Engineer prior to the land
1382 application of domestic septage to confirm the requirements and to arrange a possible
1383 DEQ/WQD inspection of the land application.

1384
1385 (ii) All records related to each septage application will be maintained for at
1386 least five (5) years.

1387
1388 (iii) There is a worksheet provided online at the Division's website that must
1389 be completed, signed, and returned to the DEQ/WQD, or the appropriate delegated local
1390 permitting authority, within 15 days of the land application.
