1 **CHAPTER 26**

2  
3 **WELL CONSTRUCTION STANDARDS**  
4

5 **Section 1. General Information.** This part contains minimum standards for design and  
6 construction and for the abandonment of wells covered by this part. The applicant or permittee  
7 shall provide for design and construction to protect Groundwaters of the State in accordance with  
8 the water quality standards contained in Chapter 8, Water Quality Rules and Regulations.  
9

10 All American Society for Testing of Materials (ASTM), American Water Works Association  
11 (AWWA) and American Petroleum Institute (API) specifications listed are intended to mean the  
12 latest revision.

13 **Section 2. Definitions Specific to Chapter 26.**  
14

15 (a) "Abandoned well" means a well regulated under this part for which use has been  
16 discontinued for more than one year and the owner does not desire to maintain this well for  
17 future use; or its use has been permanently discontinued or is in such a state of disrepair that it  
18 cannot be used for its intended purpose.  
19

20 (b) "Annular space" means the space between the well casing and the wall of the  
21 drilled hole or between two well casings.  
22

23 (c) "Artificial recharge well" means well constructed to introduce water into the  
24 ground as a means of replenishing groundwater basins.  
25

26 (d) "Commercial, municipal and industrial waste well" means well constructed to  
27 dispose of unusable waste or contaminated water resulting from a commercial activity, municipal  
28 collection, storage or treatment facility or an industrial activity.  
29

30 (e) "Conductor casing" means a tubular retaining structure installed in the upper  
31 portion of a well between the wall of the drilled hole and the inner well casing.  
32

33 (f) "Confining formation" means an impermeable bed or a bed of distinctly lower  
34 permeability than the adjacent material in which groundwater may be moving.  
35

36 (g) "Destroyed well" means a well that has been properly filled so that it cannot  
37 produce water nor act as a vertical conduit for the movement of groundwater.  
38

39 (h) "Geothermal well" means a well constructed to extract or return water to the  
40 ground after it has been used for heating or cooling purposes.  
41

42 (i) “Key seating” means a stuck drill pipe or casing caused by an abrupt change in  
43 direction or dogleg in the drilled hole.

44  
45 (j) “Miscellaneous discharge well” means a well constructed for a special process  
46 discharge of limited time and scope.

47  
48 (k) “Observation and monitor well” means a well constructed for the purpose of  
49 observing or monitoring groundwater conditions.

50  
51 (l) “Production casing” means a tubular retaining structure installed in the upper  
52 portion of a well between the wall of the drilled hole and the inner well casing.

53  
54 (m) “Sounding tube” means the access to the well casing that allows the water level in  
55 the well to be periodically determined. All sounding tubes should have a screw cap.

56  
57 (n) “Special process discharge well” means a well constructed for the use of a  
58 subsurface discharge for recovering a product or fluid at the surface. Special process discharges  
59 are defined in detail in Chapter 9, Wyoming Water Quality Rules and Regulations.

60  
61 (o) “Test well” means a well constructed for obtaining information needed to design a  
62 well prior to its construction. Test wells are cased and could be converted to observation or  
63 monitoring wells.

64  
65 (p) “Watertight” means impermeable to water except when under such pressure that  
66 structural discontinuity is produced.

67  
68 **Section 3. Application.** These standards shall apply to the types of wells listed below.  
69 Before a change of use for an existing well can occur, construction standards contained in this  
70 part shall be met for the new use.

71  
72 (a) Well type list requiring permits under Water Quality Rules and Regulations.

73  
74 (i) Commercial, municipal and industrial waste wells.

75  
76 (ii) Special process discharge wells.

77  
78 (iii) Artificial recharge and miscellaneous discharge wells.

79  
80 (iv) Geothermal wells.

81  
82 (v) Observation and monitoring wells.

83  
84 (vi) Test wells.

85 (b) Standards concerning construction, maintenance and operation of oil or gas  
86 producing, storage, injection or disposal wells are administered by the Oil and Gas Conservation  
87 Commission and therefore are not contained herein.

88 **Section 4. Well Construction Not Specifically Covered By This Part; Deviations.**

89  
90 (a) The Administrator may grant a deviation from the standards provided the  
91 applicant or permittee can supply documentation of reliability, mechanical integrity, design and  
92 construction to protect Groundwaters of the State in accordance with the water quality standards  
93 contained in Chapter 8, Wyoming Water Quality Rules and Regulations. Such documentation  
94 shall include:

- 95 (i) Theoretical technology; or
- 96 (ii) Full scale operation at another site with similar conditions; or
- 97 (iii) A pilot project of scope and length to justify a deviation.

102 **Section 5. Well Location/Siting.**

103  
104 (a) The top of the casing shall terminate above grade or above any known conditions  
105 of flooding from runoff or standing water. The area around the well shall slope away from the  
106 well. Surface drainage shall be directed away from the well.

107  
108 (b) Where a well is to be near a building, the well shall be located at a distance from  
109 the building to provide access for repairs, maintenance, etc.

110  
111 **Section 6. Sealing the Annular Space.** The annular space shall be sealed to protect it  
112 against contamination or pollution by entrance of surface and/or shallow subsurface waters.  
113 Annular seals shall be installed to provide protection for the casing against corrosion, to ensure  
114 structural integrity of the casing, and to stabilize the upper formation.

115  
116 (a) Minimum depths of seal below ground surface for various uses of wells will be:

<u>Type Well</u>	<u>Minimum Depth of Seal</u>
118 Commercial, municipal and industrial waste	30 feet
119 Special process discharge	30 feet
120 Artificial recharge and miscellaneous discharge	30 feet
121 Geothermal wells	30 feet
122 Observation and monitoring	20 feet
123 Test wells	30 feet

124  
125

126 (b) Sealing conditions. Following are requirements to be observed in sealing the  
127 annular space.

128

129 (i) Wells situated in unconsolidated, caving material shall have an oversized  
130 hole, at least four inches greater in diameter than the production casing, drilled. A conductor  
131 casing shall be installed. The space between the conductor casing and the production casing shall  
132 be filled with sealing material. The conductor casing may be withdrawn as the sealing material is  
133 placed.

134

135 (ii) Wells situated in unconsolidated material stratified with significant clay  
136 layers shall have an oversized hole of at least four inches greater in diameter than the production  
137 casing drilled, with the annular space filled with sealing material. If a clay formation is  
138 encountered within five (5) feet of the bottom of the seal, the seal should be extended five (5)  
139 feet into the clay formation.

140

141 (iii) Wells situated in soft consolidated formations shall have an oversized hole  
142 of at least four inches greater in diameter than the production casing. The annular space between  
143 the production casing and the drilled hole shall be filled with sealing material.

144

145 (iv) Wells situated in “hard” consolidated formations (crystalline or  
146 metamorphic rock) shall have an oversized hole drilled with the annular space filled with sealing  
147 material.

148

149 (c) Sealing material. The sealing material shall consist of neat cement grout, sand  
150 cement grout, bentonite clay or concrete.

151

152 (i) Cement used for sealing mixtures shall meet the requirements of ASTM  
153 C150 “Standard Specifications for Portland Cement” or API 10B “Recommended Practices for  
154 Testing Oil-Well Cements and Cement Additives”. Materials used as additives for Portland  
155 Cement mixtures in the field shall meet the requirements of ASTM C494 “Standard  
156 Specifications for Chemical Admixtures for Concrete” or API RP 10B.

157

158 (ii) Neat cement shall be composed of one sack of Portland Cement (94  
159 pounds) to 4½ to 6½ gallons of clean water.

160

161 (iii) Sand-cement grout shall be composed of not more than two parts by  
162 weight of sand and one part of Portland cement to 4½ to 6½ gallons of clean water per sack of  
163 cement.

164

165 (iv) Concrete used shall be “Class A” or “Class B”. Aggregates shall meet the  
166 requirements of ASTM C33 “Standard Specifications for Concrete Aggregates”.

167

168 (v) Special quick-setting cement, retardants to setting, and other additives,  
169 including hydrated lime to make the mix more fluid or bentonite to make the mix more fluid and  
170 reduce shrinkage, may be used.

171  
172 (vi) Bentonite clay mixtures shall be composed of bentonite clay and clean  
173 water thoroughly mixed before placement so that there are no balls, clods, etc.

174  
175 (vii) Used drillers mud or cuttings or chips from drilling the borehole shall not  
176 be used as sealing material.

177  
178 (viii) The minimum time that must be allowed for materials containing cement  
179 to “set” shall be in accordance with ASTM C150 or API RP10B. When necessary these times  
180 may be reduced by use of accelerators as determined by the well contractor.

181  
182 (d) Thickness of seal. The thickness of the seal shall be at least two (2) inches and not  
183 less than three (3) times the size of the largest coarse aggregate used in the sealing material

184  
185 (e) Placement of seal. Before placing the seal, all loose cuttings, chips, or other  
186 obstructions shall be removed from the annular space by flushing with water or fluid drilling  
187 mud. The sealing material shall be placed when possible, in one continuous operation from the  
188 bottom up. The fluid used to force the final sealing material through the casing shall remain  
189 under pressure, to prevent back flow, until the sealing material is set.

190 **Section 7. Surface Construction Features.**

191  
192 (a) Openings. Openings into the top of the well that are designed to provide access to  
193 the well, (e.g.), for measuring, chlorinating, adding gravel, etc., shall be protected against  
194 entrance of surface waters or foreign matter by installation of water tight caps or plugs. Access  
195 openings designed to permit the entrance or egress of air or gas shall terminate above the ground  
196 and above known flood levels and shall be protected against the entrance of foreign materials by  
197 installation of down turned and screened “U” bends. All other openings (holes, crevices, cracks,  
198 etc.) shall be sealed.

199  
200 A sounding tube, tap hole with plug, or similar access for the introduction of  
201 water level measuring devices may be affixed to the casing of the well as long as the proper seal  
202 is maintained. Access ports for water level or pressure measuring devices are required by the  
203 State Engineer on all wells greater than four inches diameter.

204 **Section 8. Casing.**

205  
206 (a) The casing shall provide structural stability to prevent casing collapse during  
207 installation as well as drill hole wall integrity when installed, be of required size to convey liquid  
208 at a specified injection/recovery rate and pressure, and be of required size to allow for sampling.

209  
210  
211  
212

244  
245  
246  
247  
248  
249  
250

(i) Steel casing shall meet the following conditions:

(A) Standard and line pipe. This material shall meet one of the following specifications:

- (I) API Std. 5L, “Specifications for Line Pipe.”
- (II) API Std. 5LX, “Specifications for High-Test Line Pipe.”
- (III) ASTM A53 “Standard Specification for Pipe Steel, Black and Hot Dipped, Zinc Coated Welded and Seamless.”
- (IV) ASTM A120 “Standard Specifications for Pipe, Steel, Black and Hot-Dipped Zinc-Coated (Galvanized) Welded and Seamless, for Ordinary Uses.”
- (V) ASTM A134 “Standards Specifications for Electric-Fusion (arc) - Welded Steel Plate Pipe (Sizes 16 inches and over).”
- (VI) ASTM A135 “Standard Specifications for Electric - Resistance - Welded Steel Pipe.”
- (VII) ASTM A139 “Standard Specification for Electric-Fusion (arc) - Welded Steel Pipe (Sizes 4 inches and over).”
- (VIII) ASTM A211 “Standard Specifications for Spiral - Welded Steel or Iron Pipe.”
- (IX) AWWA C200 “AWWA Standard for Steel Water Pipe 6 inches and Larger.”

(B) Structural steel. This material shall meet one of the following specifications:

- (I) ASTM A36 “Standard Specification for Structural Steel.”
- (II) ASTM A242 “Standard Specifications for High Strength Low Alloy Structural Steel.”
- (III) ASTM A283 “Standard Specification for Low and Intermediate Tensile Strength Carbon Steel Plates, Shapes and Bars of Structural Quality.”

251 (IV) ASTM A441 “Tentative Specifications for High-Strength  
252 Low Alloy Structural Manganese Vanadium Steel.”

253  
254 (V) ASTM A570 “Standard Specification for Hot-Rolled  
255 Carbon Steel Sheet and Strip, Structural Quality.”

256  
257 (C) High Strength Carbon steel sheets or “well casing steel.” Each  
258 sheet of material shall contain mill markings that identify the manufacturer and specify that the  
259 material is well casing steel that complies with the chemical and physical properties published by  
260 the manufacturer.

261  
262 (D) Stainless Steel casing shall meet the provisions of ASTM A409  
263 “Standard Specification for Welded Large Diameter Austenitic Steel Pipe for Corrosive or High  
264 Temperature Service.”

265  
266 (ii) Plastic can also be used for casing in many locations and under a variety  
267 of circumstances. The two groups of plastic materials available are thermoplastics and  
268 thermosets.

269  
270 (A) Thermoplastics. This material shall meet the requirements of  
271 ASTM F 480 “Standard Specification for Thermoplastic Water Well Casing Pipe and Couplings  
272 made in Standard Dimension Ratios (SDR).”

273  
274 (B) Thermosets. This material shall meet the requirements of the  
275 following specifications:

276  
277 (I) ASTM D2996 “Standard Specification for Filament Wound  
278 Reinforced Thermosetting Resin Pipe.”

279  
280 (II) ASTM D2997 “Standard Specification for Centrifugally  
281 Cast Reinforced Thermosetting Resin Pipe.”

282  
283 (III) ASTM D3517 “Standard Specification for Reinforced  
284 Plastic Mortar Pressure Pipe.”

285  
286 (IV) AWWA C950 “AWWA Standards for Glass - Fiber -  
287 Reinforced Thermosetting - Resin Pressure Pipe.”

288  
289 (iii) Concrete pipe used for casing should conform to the following  
290 specifications:

291 (A) ASTM C14 “Standard Specifications for Concrete Sewer, Storm  
292 Drain, and Culvert Pipe.”

293

294 (B) ASTM C76 “Standard Specification for Reinforced Concrete  
295 Culvert, Storm Drain, and Sewer Pipe.”

296  
297 (C) AWWA C300 “AWWA Standards for Reinforced Concrete  
298 Pressure Pipe, Steel Cylinder Type, for Water and Other Liquids.”

299  
300 (D) AWWA C301 “AWWA Standards for Prestressed Concrete  
301 Pressure Pipe, Steel Cylinder Type, for Water and Other Liquids.”

302  
303 (iv) Galvanized sheet metal pipe or natural wood shall not be used as casing.  
304

305 (b) All casing shall be placed with sufficient care to avoid damage to casing sections  
306 and joints. All joints in the casing above the perforations or screens shall be watertight. The  
307 uppermost perforations shall be at least below the minimum depth of seal. Casing shall be  
308 equipped with centering guides to ensure even thickness of annular seal and/or gravel pack.

309  
310 (i) Metallic casing. Steel casing may be joined by either welding or by  
311 threading and coupling.

312  
313 (ii) Plastic (non-metallic) casing. Depending on the type of material and its  
314 fabrication, plastic casing may be joined by solvent welding or may be mechanically joined.  
315 Compatibility between potential contaminants and the sealing agent used shall be demonstrated.

316  
317 **Section 9. Sealing/Cementing Off Strata.** Where a well penetrates more than one  
318 aquifer or water bearing strata, every aquifer and/or strata shall be sealed off to prevent migration  
319 of water from one aquifer or strata to another.

320  
321 (a) Strata shall be sealed off by placing impervious material opposite the strata and  
322 opposite the confining formation(s). The seal shall extend above and below the strata no less than  
323 ten (10) feet. The sealing material shall fill the annular space in the interval to be sealed, and the  
324 surrounding void spaces that might absorb the sealing material. The sealing material shall be  
325 placed from the bottom to the top of the interval to be sealed.

326  
327 (b) Commercial, municipal and industrial waste and artificial recharge wells shall be  
328 sealed/ cemented in order that all aquifers are isolated over the entire length of casing(s) and  
329 shall be surrounded by a minimum of two (2) inches of sealant. The sealant/cement plug used to  
330 isolate the aquifer(s) shall extend fifty (50) feet above and below the interface between confining  
331 layer and the aquifer(s).

332  
333 (c) Sealing material shall consist of neat cement, cement grout, or bentonite clay as  
334 per Section 6 (c).

**Section 10. Well Construction, Completion, Development and Evaluation.**

(a) Developing, redeveloping, or conditioning a well shall be done by methods that will not cause damage to the well or cause adverse subsurface conditions that may destroy barriers to the vertical movement of water between aquifers.

(b) The well opening shall be closed with a cover to prevent the introduction of undesirable material into the well and to ensure public safety whenever the well is not in use or when maintenance is being performed on the well.

(c) During well development, every well shall be tested for plumbness and alignment in accordance with AWWA or API approved standards, (i.e., deviation checks). The plumbing and alignment tests shall be documented to ensure problems such as key seating, or fatigue failures will not occur.

(d) All injection/recharge wells used for discharge of commercial, municipal or industrial wastes shall inject fluid through a tubing with a packer set immediately above the injection zone or tubing with an approval fluid seal as an alternative.

(e) At a minimum, all commercial, municipal and industrial waste, special process discharge, artificial recharge and miscellaneous discharge wells deviation checks and cement bond logs shall be conducted and documented. The Water Quality Division should be contacted prior to well construction or operation to determine the need for additional logs and tests.

**Section 11. Plugging and Abandonment.**

(a) All wells that are no longer useful (including test wells) must be plugged in order to ensure that groundwater supply is protected and preserved for further use and to eliminate the potential physical hazard. A well is considered “abandoned” when it has not been used for a period of one year, unless the owner demonstrates their intention to use the well again by properly maintaining the well in such a way that:

(i) The well has no defects that will allow the impairment of quality of water in the well or in the water bearing formations penetrated.

(ii) The well is covered and the cover is watertight.

(iii) The well is marked so that it can be clearly seen.

(iv) The area surrounding the well is kept clear of brush or debris.

Observation or test wells used in the investigation or management of usable sources of groundwater by state agencies or by engineering or research organizations are not considered

377 “abandoned” so long as they are maintained for this purpose. These wells shall be covered with  
378 an appropriate cap, and labeled for their particular use.

379  
380 (b) Preliminary work. Before a well is plugged and abandoned, it shall be  
381 investigated by the permittee (owner/ operator) to determine its condition, details of construction  
382 and whether there are obstructions that will interfere with the process of filling and sealing.

383  
384 (c) Filling and sealing. Following are requirements to be observed when plugging  
385 wells:

386  
387 (i) Wells wholly situated in unconsolidated material in an unconfined  
388 groundwater zone shall have the uppermost thirty (30) feet sealed with impervious material. The  
389 remainder of the well shall be filled with clay, sand, or other suitable inorganic matters as  
390 described in paragraph e.

391  
392 (ii) Wells penetrating several aquifers or formations containing usable water  
393 sources shall have the uppermost thirty (30) feet sealed with an impervious material. All  
394 screened or perforated intervals shall be sealed to prevent vertical movement of waters from the  
395 producing or injected formation. Impervious material shall be placed opposite the confining  
396 formation above and below (and including) the screened or perforated interval for a minimum of  
397 fifty (50) feet or more.

398  
399 (iii) Any uncased hole below the well shoe shall be filled with an impervious  
400 material as described in paragraph e. to a depth of at least fifty (50) feet above the shoe.

401  
402 (iv) Whenever production casing has been severed or inadvertently removed  
403 the well bore shall be filled with impervious material from a point fifty (50) feet below to a point  
404 50 feet above the point of severance or to the surface limit.

405  
406 (v) Wells penetrating creviced or fractured rock shall have the portions of the  
407 well opposite this formation sealed with neat cement, sand cement grout or concrete. If these  
408 formations extend to considerable depth, alternate layers of coarse stone and cement grout or  
409 concrete may be used to fill the well.

410  
411 (vi) Wells in nonfractured, consolidated formations shall have the uppermost  
412 thirty (30) feet filled with impervious material and the non-creviced, consolidated formation  
413 portion of the well may be filled with clay or other suitable material.

414  
415 (d) Placement of material. The following requirements shall be observed in placing  
416 fill or sealing a plugged or abandoned well.

417

418 (i) No material shall be placed in the well unless the Administrator has been  
419 notified that plugging and abandonment operations are to commence. A minimum of thirty (30)  
420 days notice must be given.

421  
422 (ii) The well shall be filled with the appropriate material as described in  
423 paragraph e. from the bottom of the well up.

424  
425 (iii) Sealing materials shall be placed in the interval or intervals to be sealed  
426 by methods that prevent free fall, dilution and/or separation of aggregates from cementing  
427 materials.

428  
429 (iv) When the underground pressure head producing flow is such that a  
430 counterpressure must be applied to force a sealing material into the annular space, this  
431 counterpressure shall be maintained for the length of time required for the cementing mixture to  
432 set as specified in Section 6, paragraph (c) (viii) of this part.

433  
434 (v) To ensure that the well is filled and there has been no bridging of the  
435 material, verification shall be provided that the volume of material placed in the well installation  
436 at least equals the volume of the empty hole.

437  
438 (e) Material. Requirements for sealing and fill materials are as follows.

439  
440 (i) Impervious sealing materials. Sealing materials shall have a permeability  
441 of 10 - 7 cm/sec or less. Impervious materials include neat cement, sand-cement grout, concrete,  
442 and bentonite clay as described in Section 6, paragraph (c). Used drilling muds are not  
443 acceptable.

444  
445 (ii) Filler material. Materials such as clay, silt, sand, gravel, crushed stone,  
446 native soil, and mixtures of these materials, as well as those described in paragraph (i) above  
447 may be used as filler material. Material containing organic matter or used drilling muds shall not  
448 be used.

449  
450 (f) Markings. The top of the plug of any plugged and abandoned well shall show  
451 clearly, by permanent markings, whether inscribed in the cement or on a steel plate embedded in  
452 the cement, the permit number, well identification number and date of plugging.

453  
454 (g) Reports. Within fifteen (15) days after a well has been plugged and abandoned,  
455 the owner shall file a plugging record with the Water Quality Division.
