

Me You

If all of you would actually take the time to go see the all the precautions taken in these oil and gas industries. I donât think you would have as many concerns. Where do you propose we get our power sources from? We can all go to electric vehicles but where do you think the power to charge them comes from? Or if we use solar where do you think all the parts to make the windmills and the transportation used to get the windmills to the area and built comes from? When it comes to agriculture where do you propose we get our meat from if itâs not from cattle? Did you know that humans produce methane even through breathing? Are you going to make a bill against that? Stop wasting time and money on this. Until you have a reasonable replacement for this, which in no where in sight at this time, put your energy into something that is actually worth while. Leave Wyoming alone. The next time your power goes out and your mad, think about all of us here in Wyoming and many other states jumping through millions of miles of red tape to make sure oil and gas extraction is safe, and when your power comes back and you breath a sigh of relief so you can do your laundry eat food thatâs not spoiled, heat your house in the winter and cool your house in the summer or even charge your electric vehicle. Remember where that source comes from. Your welcome!!
