

Barbara Easterlin

Hello,

I am writing regarding the R-37 proposed rule making. Greenhouse gas emissions are probably the biggest existential threat to humanity and our biosphere there is. Methane traps more heat than CO2 emissions and is a serious threat to our atmosphere, contributing to unsustainable warming and, yes, climate change. I urge you, on behalf of all of our children and future generations, to no ease the current goal and fossil fuel emission standards. Many thanks, Barb Easterlin
