CHAPTER 25

SEPTIC TANKS, SOIL ABSORPTION SYSTEMS, AND OTHER SMALL WASTEWATER SYSTEMS

Section 1. Authority.

This rule is promulgated pursuant to Wyoming Statutes (W.S.) 35-11-101 through 35-11-1904, specifically 35-11-302(a)(iii).

Section 2. Objective.

This Chapter contains the minimum standards for the design and construction of small wastewater systems which are defined by W.S. 35-11-103(c)(ix). In addition, this Chapter contains the minimum standards for the design and construction of Underground Injection Control (UIC) Class V facilities 5C1-5C3, 5C6, 5D1, 5E1, 5E3-5E5 as defined in Chapter 16, Appendices A and B.

The following situations will require the application package to be sealed, signed, and dated by a professional engineer (PE): non-domestic wastewater from commercial and industrial facilities, high strength wastewater, individual permits to construct, or standard soil absorption systems with a soil percolation rate which is either less than 5 minutes per inch (mpi) or more than 60 minutes per inch (mpi).

These standards pertain to permits required pursuant to Chapters 3 and 25, Wyoming Water Quality Rules and Regulations. The installation of all components of a small wastewater system require a permit to construct. Permits to construct are specified throughout this chapter as general permits, described in Chapter 3, Section 7; permit by rule, described in Chapter 3, Section 8; or as individual permits to construct, described in Chapter 3, Section 6.

Section 3. Definitions.

(a) “**Absorption surface**” means the interface where treated effluent infiltrates into native or fill soil.

(b) “**Bed**” means a soil treatment and dispersal system where the width is greater than three (3) feet.

(c) “**Bedrock**” means geological layers, of which greater than fifty percent (50%) by volume consist of unweathered in-place consolidated rock or rock fragments. Bedrock also means weathered in-place rock which cannot be hand augered or penetrated with a knife blade.

(d) “**Bedroom**” means any room that is or may be used for sleeping.

(e) “**Blackwater**” means water containing fecal matter and/or urine.

(f) “**Five day biochemical oxygen demand (BOD₅)**” means a measurement of the dissolved oxygen used by microorganisms in the biochemical oxidation of organic matter during a five (5) day period.

- (g) **“Building sewer”** means the pipe which carries wastewater from the building.
- (h) **“Chamber”** means a domed open bottom structure that is used in lieu of perforated distribution pipe and gravel media.
- (i) **“Delegated small wastewater program”** means a local governmental entity, delegated by the Administrator, with the authority to administer the provisions of W.S. 35-11-301(a) (iii) for small wastewater systems pursuant to the provisions of W.S. 35-11-304.
- (j) **“Direct human consumption food crops”** are crops consumed directly by humans. These include but are not limited to fruits, vegetables, and grains grown for human consumption.
- (k) **“Domestic wastewater”** means a combination of the liquid or water-carried wastes from residences, business buildings, institutions, and other establishments arising from normal living activities.
- (l) **“Domestic septage”** means liquid or solid material removed from a waste treatment vessel that has received only wastes from residences, business buildings, institutions, and other establishments arising from normal living activities.
- (m) **“Dosing tank”** means a tank equipped with an automatic siphon or pump designed to discharge effluent on an intermittent basis.
- (n) **“Effluent”** means liquid flowing out of a septic tank, other treatment vessel, or system.
- (o) **“Effluent filter”** means a removable, cleanable device inserted into the outlet piping of a septic tank or other treatment vessel designed to trap solids that would otherwise be transported to the soil absorption system or other downstream treatment components.
- (p) **“Evapotranspiration”** means the combined loss of water from soil by evaporation from the soil or water surface and by transpiration from plants.
- (q) **“Greywater”** means untreated wastewater that has not been contaminated by any toilet discharge, which is unaffected by infectious, contaminated, or unhealthy bodily wastes, and does not present a threat from contamination by unhealthful processing, manufacturing, or operating wastes. “Greywater” includes but is not limited to wastewater from bathtubs, showers, washbasins, clothes washing machines (unless soiled diapers are serviced), laundry tubs, and kitchen sinks.
- (r) **“Grease interceptor”** means a device designed to separate fats, oils, and grease from wastewater.
- (s) **“Groundwater”** means subsurface water that fills available openings in rock or soil materials such that they may be considered water saturated under hydrostatic pressure.
- (t) **“High groundwater”** means seasonally or periodically elevated levels of groundwater.

- 99
100 (u) “**High strength wastewater**” means a wastewater stream with a BOD₅ higher than
101 200 mg/L.
102
103 (v) “**Holding tank**” means a watertight receptacle designed to receive and store
104 wastewater.
105
106 (w) “**Manifold**” means a non-perforated pipe that distributes effluent to individual
107 distribution pipes.
108
109 (x) “**Mound system**” means an onsite wastewater system where the bottom of the
110 absorption surface is above the elevation of the existing site grade and the absorption surface is
111 contained in a mounded fill body above the grade.
112
113 (y) “**Mulch basin**” means an excavated area that has been refilled with a highly
114 permeable media, organic and inorganic materials intended to distribute greywater to irrigate
115 vegetation.
116
117 (z) “**Pathogens**” are disease-causing organisms. These include, but are
118 not limited to certain bacteria, protozoa, viruses, and viable helminth ova.
119
120 (aa) “**Percolation rate**” means the time expressed in minutes per inch required for water
121 to seep into saturated soil at a constant rate.
122
123 (bb) “**Pipe invert**” means the bottom or lowest horizontal point of the internal surface of
124 the pipe.
125
126 (cc) “**Percolation test**” means the method used to measure the percolation rate of water
127 into soil as described in Appendix A.
128
129 (dd) “**Permit by rule**” means an authorization included in these rules which does not
130 require either an individual permit or a general permit. A facility which is permitted by rule must
131 meet the requirements found in this chapter, but is not required to apply for and obtain a permit to
132 construct and operate the facility.
133
134 (ee) “**Pressure distribution**” means a network of pipes in which effluent is forced
135 through orifices under pressure.
136
137 (ff) “**Restrictive layer**” means a nearly continuous layer that has one or more physical
138 or chemical properties that significantly impede the movement of water and air through the soil or
139 that restrict roots or otherwise provide unfavorable root conditions. Examples are bedrock,
140 cemented layers, and dense layers.
141
142 (gg) “**Septage**” means liquid or solid material removed from a waste treatment vessel
143 that has received wastes from residences, business buildings, institutions, and other
144 establishments.

(hh) “**Septic tank**” means a buried, watertight tank designed and constructed to receive and treat raw wastewater.

(ii) “**Service provider**” means a person authorized and trained by a system manufacturer or their vendor to operate and maintain any proprietary system.

(jj) “**Soil absorption system**” means a shallow, covered, excavation made in unsaturated soil into which wastewater effluent from the septic tank is discharged through distribution piping for application onto absorption surfaces through porous media or manufactured components placed in the excavations.

(kk) “**Trench**” means an absorption surface with a width of three (3) feet or less.

Section 4. Design Flows.

The volume of wastewater shall be determined by one of the following:

- (a) Tables 1 and 2 provided in this section.
- (b) Metered water supply data from the facility.
- (c) Metered water supply data from another facility where similar water demands have been demonstrated.

Table 1. Residential Design Flow Rates per Bedroom (gallons per day, gpd)¹

1 bedroom	150
2 bedrooms	280
3 bedrooms	390
4 bedrooms	470
5 bedrooms	550
6 bedrooms	630

¹An unfinished basement is considered two (2) additional bedrooms.

²The design flow shall be increased by eighty (80) gpd for each additional bedroom over six (6).

Section 5. Systems Not Specifically Covered by This Rule.

This section is provided to encourage new technology and equipment and provide a process for evaluating and permitting designs which deviate from this rule. The proposed construction of facilities and processes not in compliance with this rule may be permitted provided that the facility, when constructed and operated, meets the objective of these rules.

196 (a) Each application for a permit to construct shall include an engineering design report,
197 detailed construction plans, and technical specifications for all piping, tanks, and equipment. All
198 of the documents shall have a suitable title showing the owner's name and the Wyoming
199 registration number, seal, and signature of the engineer.

200
201 (b) Each application for a permit to construct will be evaluated on a case-by-case basis
202 using the best available technology. The application shall include at least one of the following:

203 (i) Data obtained from a full scale, comparable installation which demonstrates the
204 acceptability of the design.

205
206 (ii) Data obtained from a pilot plant operated under the design condition for a
207 sufficient length of time to demonstrate the acceptability of the design.

208 (iii) Data obtained from the theoretical evaluation of the design that demonstrates a
209 reasonable probability the facility will meet the design objectives.

210 (iv) An evaluation of the flexibility of making corrective changes to the constructed
211 facility in the event it does not function as planned.

212
213 (c) If an applicant wishes to construct a pilot plant to provide data necessary to show the
214 design will meet the purpose of the act, a permit to construct must be obtained.

215
216
217
218 **Section 6. Site Suitability.**

219
220 (a) Small wastewater systems must be located where the surface drainage is sufficient to
221 allow proper operation of the small wastewater system.. Avoid depressions and bases of slopes
222 and areas in the path of runoff from roofs, patios, driveways, or other paved areas unless surface
223 drainage is provided. Small wastewater systems shall not be located beneath buildings, parking
224 lots, roadways, driveways, irrigated landscaping, or compacted areas.

225
226 (b) The site must include area for both the proposed soil absorption system and a future
227 replacement soil absorption system. Both the proposed and replacement soil absorption systems
228 shall be sized to receive one-hundred (100%) percent of the wastewater flow. If a trench system
229 is used, the replacement soil absorption system may be located between the trenches of the
230 proposed soil absorption system if there is at least nine (9) feet of spacing between trench
231 sidewalls.

232
233 (c) For standard soil absorption systems, effective suitable soil depth shall extend at least
234 four (4) feet below the bottom of the soil absorption system to any restrictive layer, fractured
235 rock, or highly permeable material.

236
237 (d) The depth to high groundwater shall be at least four (4) feet below the bottom of the
238 absorption surface for all treatment systems except pressure distribution. For pressure distribution
239 systems, the depth to high groundwater shall be at least three (3) feet below the bottom of the
240 absorption surface if the percolation rate of the soil is five (5) minutes per inch or greater (5-60
241 mpi).

242
243 (e) Slope
244

245
 246 (i) Table 3 shows the maximum permissible slopes of the site on which an
 247 absorption system may be constructed
 248

249 **Table 3. Slope and Percolation Rates for Absorption Systems**

Percolation Rate (minutes/inch)	Maximum Slope ¹
5	25%
6-45	20%
46-60	15%

250 ¹ Flatter slopes may be required where the effluent surfaces downslope.

251
 252 (ii) Serial distribution, with the use of drop boxes or approved fittings, is the
 253 preferred installation method for sloping terrain. The bottom of individual trenches shall be level
 254 and the trenches shall be constructed to follow the contours of the land.
 255

256 (iii) The placement of multiple trenches, with each subsequent trench down slope of
 257 the previous trench shall be avoided when the addition of effluent to the soil absorption system
 258 trenches may lead to either an unstable slope or seepage down slope.
 259

260 (iv) All absorption surfaces must be located at least 15 horizontal feet from the top
 261 of any break in slope which exceeds the maximum slope allowed.
 262

263 (f) Soil Exploration Pit and Percolation Tests

264
 265 (i) Delegated small wastewater programs shall require a percolation test in
 266 addition to the soil exploration pit.
 267

268 (ii) A minimum of one soil exploration pit within the proposed soil absorption
 269 system location shall be excavated to a minimum depth of four (4) feet below the bottom of the
 270 proposed soil absorption system to evaluate the subsurface conditions.
 271

272 (iii) The percolation test shall be performed in accordance with Appendix A of this
 273 chapter. An evaluation of the soil texture, in the proposed soil absorption system location, by a
 274 person experienced in soils classification, may be used as an additional tool to confirm the
 275 percolation rate.

315
316

¹ For disposal of non-domestic wastewater, the setback distance shall be determined by a hydrogeological study in accordance with Section 17(b) of Chapter 3, but shall not be less than the distances shown in Table 4.

² Small wastewater systems that discharge to the same aquifer that supplies a public water supply well and are located within Zone 1 or 2 (Attenuation) of the public water supply well, as determined by [Wyoming Department of Environmental Quality Source Water Assessment Project \(2004\)](#) or as established in Section 2 of the [Wyoming Wellhead Protection Guidance Document \(1997\)](#), shall provide additional treatment. These systems will be required to obtain an individual permit to construct and will require that a PE sign, stamp, and date the application, as stated in Section 2 of this chapter. The additional treatment shall be in accordance with Chapter 3 Section 2(b)(ii). The treatment shall reduce the nitrates to less than 10 mg/L of NO₃- as N and provide 4-log removal of pathogens before the discharge leaves the property boundary of each small wastewater system.

317
318
319 **Section 7. Soil Absorption System Sizing.**
320

321 (a) The total infiltration surface area of a soil absorption system shall be calculated by
322 dividing the design flow rates (gpd) from Table 1 or Table 2 by the loading rate (gpd/ft²) found in
323 Table 5.
324

325 **Table 5. Rates of Wastewater Application for Soil Absorption System Areas**

326 Percolation Rate 327 (mpi)	328 Loading Rate 329 (gpd/ft ²)	330 Percolation Rate 331 (mpi)	332 Loading Rate 333 (gpd/ft ²)
334 5	335 0.80	336 21	337 0.45
338 6	339 0.75	340 22	341 0.44
342 7	343 0.71	344 23-24	345 0.43
346 8	347 0.68	348 25	349 0.42
350 9	351 0.65	352 26-27	353 0.41
354 10	355 0.62	356 28-29	357 0.40
358 11	359 0.60	360 30-31	361 0.39
362 12	363 0.58	364 32-33	365 0.38
366 13	367 0.56	368 34-35	369 0.37
370 14	371 0.54	372 36-37	373 0.36
374 15	375 0.52	376 38-40	377 0.35
378 16	379 0.50	380 41-43	381 0.34
382 17	383 0.49	384 44-46	385 0.33
386 18	387 0.48	388 47-50	389 0.32
390 19	391 0.47	392 51-55	393 0.31
394 20	395 0.46	396 56-60	397 0.30

398 (b) The total infiltration area shall be defined as follows:

399 (i) For standard trenches the total infiltration area shall be calculated based on the
400 following formula:

$$401 A = L(W + 2S)$$

402 A = Total infiltration area

403 L = Total length of trench

404 W = Bottom width

405 S = Sidewall height of 12 inches or less

406 (A) The sidewall height is the depth below the flowline of the pipe to the
407 bottom of the trench.

408 (B) The maximum credit for sidewall height shall not exceed twelve (12)
409 inches even if the actual sidewall height exceeds twelve inches.

349 (ii) For chamber trenches, the total infiltration area shall be calculated based on the
350 following formula:

$$351 \quad A = L(E + 2S)$$

352
353
354 A = Total infiltration area

355
356 L = Total length of trench

357
358 E = Effective bottom width (Multiply width of the chamber by factor of 1.43 to
359 get effective bottom width)

360
361 S = Sidewall height of 12 inches or less

362
363 (A) The factor of 1.43 incorporates a thirty percent (30%) reduction of the
364 bottom area.

365
366 (B) The maximum credit for sidewall height shall not exceed twelve (12)
367 inches even if the actual sidewall height exceeds twelve (12) inches.

368
369 (C) The sidewall height is the height of the slotted sidewall of the chamber or
370 depth below the flow line of the inlet pipe, whichever is less.

371
372 (iii) For bed systems, the total infiltration area shall be calculated based on the
373 following formula:

$$374 \quad A = LW$$

375
376 A = Total infiltration area

377
378 L = Total length of bed

379
380 W = Width of the bed

381
382 (A) The sidewall credit shall not be used in calculating the total infiltration area
383 for a bed system.

384
385 (c) Coarse sand or soils having a percolation rate less than one (1) minute per inch (mpi)
386 are unsuitable for subsurface effluent disposal. These soils may be used if a one (1) foot layer of
387 fine sand or loamy sand is placed below the constructed soil absorption system. The soil
388 absorption system shall be sized based on the percolation rate of the fill material.

389 **Section 8. Building Sewer Pipes.**

390
391 All building sewers shall be installed in accordance with the 2012 International Plumbing
392 Code (IPC). In the absence of a locally approved plumbing code, and in addition to the IPC, the
393 building sewer shall comply with the following:

394
395 (a) Suitable building sewer pipe materials are Polyvinyl Chloride (PVC) or
396 Acrylonitrile-Butadiene-Styrene (ABS). The septic tank inlet and outlet pipes shall be schedule
397

398 40 PVC or ABS pipe and shall span the excavations for the septic tank and/or dosing chamber.
399 American Society for Testing and Materials (ASTM) D-3034 Standard Dimension Ratio (SDR)
400 35 plastic pipe may be used if the void at the tank's side is filled with material which is granular,
401 clean, and compacted.
402

403 (b) Building sewer pipes shall be sized to handle the peak hourly flow from the building
404 and shall not be smaller than four (4) inches in diameter. When two different sizes or types of
405 sewer pipes are to be connected, a proper type of fitting or conversion adapter shall be used.
406

407 (c) Sewer pipe shall not decrease in size flowing downstream.
408

409 (d) Building sewer pipes shall be laid at a standard slope of 1/4 inch per foot, and shall
410 not be flatter than 1/8 inch per foot.
411

412 (e) Cleanouts shall be provided at branch connections, every change in alignment, and at
413 least every 100 feet in straight runs.
414

415 (f) All sewer piping shall be laid on a firm bed throughout its entire length. It shall be
416 protected from damage due to rocks, hard lumps of soil, debris, and the like.
417

418 (g) Special care shall be used to prevent lateral movement or deformation during
419 backfill. The backfill material shall be compacted to a density at least equivalent to the trench
420 walls. Backfill over the pipe shall be of sufficient depth to protect the pipe from expected traffic
421 loads and the wastewater from freezing.
422

423 **Section 9. Septic Tanks and Other Treatment Tanks.**
424

425 (a) Septic Tanks
426

427 (i) Septic tanks shall be fabricated or constructed of concrete, fiberglass or an
428 approved material. Tanks shall be watertight and fabricated to constitute an individual structure,
429 and shall be designed and constructed to withstand anticipated loads. As part of the application
430 review process, Department of Environmental Quality, Water Quality Division (DEQ/WQD) or
431 the delegated small wastewater program shall review the design of prefabricated septic tanks for
432 compliance with applicable construction standards.
433

434 (ii) The septic tank shall be placed on a level grade and a firm bedding to prevent
435 settling. Where rock or other undesirable protruding obstructions are encountered, the opening
436 for the septic tank shall be over excavated, as needed, and backfilled with sand, crushed stone, or
437 gravel to the proper grade.
438

439 (A) Septic tanks shall not be buried deeper than the tank manufacturer's
440 maximum designed depth for the tank. The minimum depth of soil cover over the top of the tank
441 is six (6) inches.
442

443 (B) Backfill around and over the septic tank shall be placed in such a manner
444 as to prevent undue strain or damage to the tank or connected pipes.
445

446 (C) Septic tanks shall not be placed in areas subject to vehicular traffic unless
447 engineered for the anticipated load.

448
449 (iii) Size

450
451 (A) The minimum liquid volume of a septic tank shall be 1000 gallons for
452 residences up to a four (4) bedroom capacity. Additional capacity of 150 gallons per bedroom
453 shall be provided for each bedroom over four (4).

454
455 (B) Septic tanks for high strength wastewater or non-residential units shall
456 have a minimum effective liquid capacity sufficient to provide at least 48 hour retention at design
457 flow or 1,000 gallons, whichever is greater.

458
459 (iv) Configuration

460
461 (A) Single compartment septic tanks shall have a length to width ratio of no
462 less than two (2) to one (1), or be partitioned to protect against short circuiting flow.

463
464 (B) For septic tanks with two (2) compartments or more, the inlet
465 compartment shall not be less than one-half (1/2) of the total capacity of the tank.

466
467 (C) The liquid depth shall be between three (3) feet and six (6) feet.

468
469 (D) The tank partition shall allow the venting of gases between
470 compartments and out through the vent stack on the plumbing system of the house.

471
472 (E) The inlet and outlet on all tanks or tank compartments shall be provided
473 with open-ended sanitary tees or baffles made of approved materials constructed to distribute
474 flow and retain scum in the tank or compartments.

475
476 (I) The tees or baffles shall extend above the liquid level a minimum
477 distance of six (6) inches.

478
479 (II) The tees or baffles shall extend below the liquid level a distance
480 equal to thirty to forty percent (30-40%) of the liquid depth.

481
482 (III) A minimum of three (3) inches of clear space shall be provided
483 over the top of the baffles or tees.

484
485 (IV) The inlet pipe shall be at least two (2) inches higher than the outlet
486 pipe. The outlet elevation shall be designed to provide a minimum distance of nine (9) inches or
487 twenty (20) percent of the liquid depth, whichever is greater, between the top of the liquid and the
488 bottom of the septic tank cover for scum storage and the venting of gases.

489
490 (v) If additional septic tank capacity over 1,000 gallons is needed, it may be
491 obtained by joining tanks in series provided the following requirements are met:
492

493 (A) The inlet of each successive tank shall be at least two (2) inches lower
 494 than the outlet of the preceding tank, and shall have no tee or baffle except for the inlet to the first
 495 tank and the outlet for the last tank.

496
 497 (B) The first tank or the first compartment of the first tank shall be equal to
 498 fifty percent (50%) or larger of the total septic tank system volume.

499
 500 (vi) An access shall be provided to each compartment of the septic tank for
 501 inspection and cleaning.

502
 503 (A) The access shall have a minimum diameter of twenty (20) inches. Both
 504 inlet and outlet devices shall be accessible.

505
 506 (B) The riser shall terminate at a maximum of six (6) inches below the
 507 ground surface. Riser covers terminating above grade shall have an approved locking device.

508
 509 (vii) Land application of domestic septage in remote areas that meet the conditions
 510 found in Appendix B will be permitted as a permit by rule. Delegated small wastewater programs
 511 may issue individual permits.

512
 513 (viii) An effluent filter with an opening of 1/8-inch or smaller shall be provided on
 514 the outlet of a septic tank or other tank that precedes a small diameter pressure distribution
 515 system.

516
 517 (b) Dosing Tanks

518
 519 (i) Dosing tanks shall meet the same material and installation requirements as
 520 septic tanks. Dosing tanks shall have a minimum 20-inch diameter access riser and it shall be
 521 brought to the ground surface. The following table shall be used to calculate the size of the dosing
 522 tank:

523
 524 **Table 6. Dosing Tank Volume (gallons)**

Average Design Flows (gpd)	0-499	500-999	1000-1499	1500-2000
Between Pump “off” and Tank Inlet	350	700	1000	1300
Between Tank Inlet and Alarm Switch	200	400	600	800
Between Alarm switch and Pump “on”	50	100	100	100
Between Pump “on” and Pump “off”	100	200	300	400
Recommended Pump Capacity (gpm)	10	20	30	40

525
 526 (ii) High water alarms shall be provided for all tanks that utilize pumps or siphons.
 527 The alarm device shall be an audible alarm or an indoor illuminated alarm or both.

528
 529 (iii) The minimum effluent level shall achieve complete submergence of the pump.

530
 531 (iv) Dosed systems using a siphon shall have a dose counter installed to check for
 532 continued function of the siphon.

533
 534 (c) Holding Tanks

535
536
537
538
539
540
541

581
582
583

(i) Holding tanks shall meet the same material requirements as septic tanks. Holding tanks shall have a twenty (20)-inch minimum diameter access riser. The riser shall be brought to ground surface.

(ii) Holding tanks shall not be used for residential systems when other alternative systems are available, except on a temporary, seasonal or intermittent basis, or when used to correct a failed soil absorption system when other alternatives are unavailable.

(iii) Holding tanks must be located in an area readily accessible to the pump truck and where the tank itself will not float due to high groundwater. If seasonal high groundwater may be present, the tank shall be properly anchored.

(iv) The minimum liquid volume shall be the greater of 1,000 gallons or seven (7) days storage based upon flow rate determined from Section 4.

(v) All holding tanks shall be equipped with a high-water level alarm. The device shall be an audible alarm or an indoor illuminated alarm or both. The device shall be installed so that the alarm is triggered when the water level reaches 3/4 of the tank capacity.

(vi) A design package for holding tanks is provided online at the Division's website to assist the applicant in submitting a completed application for coverage under the general permit for small wastewater systems. The worksheet and calculations were prepared by a registered professional engineer employed by the Wyoming Department of Environmental Quality, Water Quality Division. The general design requirements stated in this section are incorporated into the worksheets such that by properly completing the forms and installing the components, the system will comply with these requirements.

(d) Grease Interceptors

(i) A commercial or institutional food preparation facility with a waste stream containing fat, oil, and grease (FOG) in excess of 25 mg/L shall install an exterior grease interceptor or a device approved by the delegated health department or county. Facilities that typically have waste streams high in FOG are, but not limited to, restaurants, cafeterias, slaughterhouses, and institutional kitchens.

(ii) Waste streams high in FOG shall be plumbed separately and directly to a grease interceptor prior to the waste treatment process.

(iii) Waste streams from sanitary facilities such as bathrooms, toilets, urinals, or other similar fixtures shall not be discharged into the grease interceptor. These sources must be connected at least four to six (4-6) feet downstream of the grease interceptor's discharge. The design shall prevent any backflow from the sanitary sources into the grease interceptor.

(iv) Only one source facility per grease interceptor shall be allowed.

(v) Grease interceptors shall be located so that they are easily accessible for inspection, cleaning, and removal of the collected wastes. The interceptor shall not be closer than fifteen (15) feet from the last discharging fixture and no further away than thirty-five (35) feet.

584
 585 (vi) Grease interceptors shall have at least two (2) compartments with a 20-inch
 586 minimum diameter cleanout riser for each compartment. Each cleanout riser shall be brought to
 587 the surface and have a sealed lid that is rated for any anticipated load. There shall be a means
 588 provided to sample the effluent.

589 (vii) There shall be no internal cleanout tees or bypasses.

591 (viii) The inlet and outlet of the grease interceptor shall be vented. The vent pipe
 592 shall be at least two (2) inches in diameter. The inlet and outlet vents shall not be interconnected.

594 (ix) The outlet pipe invert shall be no more than two (2) inches lower than the inlet
 595 invert.

597 (x) The dividing wall between compartments shall be the same height as the other
 598 walls and the cover must contact the top of the dividing wall.

600 (xi) The effluent from each compartment shall be drawn from the bottom of a riser
 601 pipe that terminates at least eighteen (18) inches below the inlet pipe invert of that same
 602 compartment.

604 (xii) Grease interceptors shall be accessible during normal business hours without
 605 interrupting normal business operations.

607 (xiii) Grease interceptors shall be installed in accordance with the manufacturer's
 608 instructions and applicable requirements of this section. A copy of the manufacturer's
 609 instructions shall be submitted with every permit to construct application submitted to
 610 DEQ/WQD.

611 (xiv) Grease interceptors shall be sized according to the following:

Kitchens (grease, garbage)

Number of meals per peak hour	X	Waste Flow rate*	X	Retention time**	X	Storage factor***	=	Interceptor size (liquid capacity)
-------------------------------	----------	------------------	----------	------------------	----------	-------------------	---	------------------------------------

617 *Waste flow rate – see Table 2.
 618

619 **Retention times

Kitchen waste:	
Dishwasher and/or disposal	2.5 hours
Single service kitchen:	
Single serving with disposal	1.5 hours

622 ***Storage factors

Fully equipped commercial kitchen	8 hr. operation: 1 16 hr. operation: 2
-----------------------------------	---

	24 hr. operation: 3
Single service kitchen:	1.5

625

(A) The minimum interceptor size (liquid capacity) shall be 750 gallons.

626

627

(e) Other Interceptors

628

629

(i) Interceptors are required for oil, grease, sand, and other substances harmful or hazardous to the building drainage system, or the small wastewater treatment system.

630

631

632

(A) Laundries

633

634

(I) Commercial laundries, Laundromats, and dry-cleaners shall be equipped with an interceptor in order to reduce the quantity of lint and silt that enter the collection system.

635

636

637

638

(II) The system must be of adequate size and design to allow for cool-down of wastewater so that separation can be more readily achieved.

639

640

641

(III) The interceptor shall be installed with a wire basket or similar device. The wire basket or similar device shall be removable for cleaning and shall prevent passage into the drainage system of solids 1/2 inch (12.7 mm) or larger in size, such as string, rags, buttons, or other materials which are detrimental to the waste treatment system.

642

643

644

645

646

(IV) Sizing must be in accordance with the following formula:

647

648

Laundries (grease, lint, silt)

649

650

Total gallons per cycle	X	Cycles per hour	X	Retention time*	X	Storage factor**	=	Interceptor
-------------------------	---	-----------------	---	-----------------	---	------------------	---	-------------

651

*Retention times

652

653

Institutional laundries	2.5 hours
Standard commercial laundry	2.0 hours
Light commercial laundry	1.5 hours

654

**Storage factors

655

656

8 hours of operation	1.0
12 or more hours of operation	1.5

657

658

(B) Car Washes

659

660

(I) Where automobiles are washed (including detail shops using hand-wash practices), separators shall have a minimum capacity of 1000 gallons for the first bay, with an additional 500 gallons of capacity for every other bay.

661

662

663

664

665 (II) Additionally, wash racks must be constructed to eliminate or
666 minimize the impact of run-off from rain/storm events. Minimum requirements are roofed
667 structures with at least two walls and appropriate grading to prevent stormwater infiltration into
668 the sanitary sewer.

669 (III) An effluent sampling point is required.
670

671 (f) Abandonment of Septic and Holding Tanks

672 The following is the procedure to abandon septic tanks and holding tanks when the system is
673 upgraded, equipment replacement is necessary, or central sewer lines are made available.
674

675 (i) The abandoned tank should be pumped and the septage hauled to a licensed
676 facility approved to receive the waste or the septage pumped into the newly constructed septic or
677 holding tank. Discharging to a central sewer requires coordination with, and the approval of, the
678 owner/operator of the sewer system.
679

680 (ii) Once the abandoned tank is empty, it should be removed and the excavation
681 backfilled. As an alternative to removing the tank, the access covers can be removed and the tank
682 filled with native soil, pit run, or sand.
683

684 (iii) If the abandoned tank is part of a Class V UIC facility, the abandonment must
685 also be in compliance with Chapter 16, Section 12.
686

687 **Section 10. Effluent Distribution Devices.**
688

689 Distribution boxes and flow divider tees are suitable for level or nearly level ground and are
690 installed before the soil absorption system with the goal of splitting flows equally between soil
691 absorption system laterals. Drop boxes are suitable for sloping ground and are installed to
692 achieve serial loading.
693

694 (a) Distribution Boxes
695

696 (i) The distribution box shall be installed on a level, stable base to prevent tilting
697 or settling, and to minimize movement from frost heave.
698

699 (ii) Boxes shall be watertight and constructed of concrete or other durable material.
700

701 (iii) Boxes shall be designed to accommodate the inlet pipe and the necessary
702 distribution lines. The inlet piping to the distribution box shall be at least one (1) inch above the
703 outlet pipes and all pipes shall have a watertight connection to the distribution box.
704

705 (iv) The box shall be protected against freezing and made accessible for
706 observation and maintenance.
707

708 (v) Boxes shall have flow equalizers installed on each outflow.
709

710 (b) Flow divider tees may be used in place of distribution boxes.
711

712 (c) Drop boxes are suitable for sloping ground and are installed to achieve serial loading.
713 The drop boxes shall meet the requirements in paragraphs (a)(i through v) of this section.

714 **Section 11. Standard Soil Absorption Systems.**

715
716 (a) General Design Requirements:

717 (i) All soil absorption systems shall be designed in such a manner that the effluent
718 is effectively filtered and retained below the ground surface. The absorption surface accepts,
719 treats, and disperses wastewater as it percolates through the soil.

720 (ii) Soil absorption systems shall not be excavated when the soil is wet enough to
721 smear or compact easily. Open soil absorption system excavations shall be protected from
722 surface runoff to prevent the entrance of silt and debris. All smeared or compacted surfaces shall
723 be raked to a depth of one (1) inch, and loose material removed before filter or filler material is
724 placed in the soil absorption system excavation.

725
726 (iii) Soil absorption systems shall be designed to approximately follow the ground
727 surface contours so that variation in excavation depths will be minimized. The trenches may be
728 installed at different elevations, but the bottom of each individual trench shall be level throughout
729 its length.

730
731 (iv) Shallow soil absorption system depths are encouraged to promote treatment
732 and evapotranspiration. The minimum soil cover depth over the soil absorption system is one (1)
733 foot. The maximum depth to the bottom absorption surface of a soil absorption system is five (5)
734 feet. Finished grading shall prevent ponding and promote surface water runoff.

735
736 (v) Pipes, chambers or other products shall be bedded on firm, stable material.
737 Heavy equipment shall not be driven in or over soil absorption systems during construction or
738 backfilling.

739
740 (vi) Standard trenches refer to perforated pipe embedded in aggregate-filled
741 trenches which shall conform to the following:

742
743 (A) The perforated pipe shall have a minimum diameter of 4 inches. Suitable
744 pipe materials include: ASTM D-2729-11 PVC, ASTM D-3034-08 PVC, Schedule 40 PVC
745 ASTM d1784-11, and ASTM F810-07 PE.

746
747 (B) The aggregate shall be crushed rock, gravel or other acceptable, durable
748 and inert material which is free of fines, and has an effective diameter between ½ inch and 2- ½
749 inches.

750
751 (C) Prior to backfilling, the aggregate shall be covered throughout with a
752 woven/non-woven geotextile material or a three (3) inch layer of straw.

753
754 (D) Aggregate shall extend the full width and length of the soil absorption
755 system to a depth of at least twelve (12) inches with at least six (6) inches of drain gravel under
756 the distribution pipe and at least two (2) inches over the distribution pipe.

791
792
793
794
795
796
797
798
799

(E) Maximum width of trench excavation is three (3) feet.

(F) Minimum spacing of trenches (wall to wall) is three (3) feet. Trench spacing shall be increased to nine (9) feet when the area between each trench is considered as reserve area. For clay loam soils that have percolation rates greater than 60 min/in., the nine (9) foot spacing shall also be required but it is not considered as reserve area.

(vii) Standard beds shall conform to the same pipe and aggregate requirements for trenches as found in subparagraphs (vi)(A through D) of this section. Standard beds shall also conform to the following:

(A) The soils shall have percolation rates less than 60 minutes per inch (5-60 mpi). The bottom of the bed must be level, therefore the site shall be relatively flat, sloping no more than one (1) foot from the highest to the lowest point in the installation area.

(B) Distribution laterals within a bed must be spaced on not greater than six (6) feet centers. Sidewalls shall not be more than three (3) feet from a distribution lateral.

(C) Beds must not be wider than twenty-five (25) feet if gravity distribution is used. Multiple beds must be spaced at one-half the bed width.

(D) Rubber tired vehicles must not be driven on the bottom surface of any bed excavation.

(viii) Chambered trenches, when used in lieu of perforated pipe and aggregate, shall be installed in conformance with the manufacturer recommendations. No cracked, weakened, modified, or otherwise damaged chamber units shall be used in any installation.

(A) All chambers shall be an open, arch-shaped structure of durable, non-degradable design, suitable for distribution of effluent without filter material.

(B) All chamber endplates shall be designed so that the bottom elevation of the inlet pipe is at least six (6) inches from the bottom of the chamber.

(C) Inlet and outlet effluent sewer pipes shall enter and exit the chamber endplates. Inspection ports shall be installed at all outlet effluent sewer pipes.

(D) All chambers shall have a splash plate under the inlet pipe or another design feature to avoid unnecessary channeling into the trench bottom.

(E) The maximum width of the bottom absorption surface for a chambered trench is three (3) feet. The excavation to install a chambered trench may exceed three (3) feet.

800

801 (F) Minimum spacing of trenches (wall to wall) is three (3) feet. Trench
802 spacing shall be increased to nine (9) feet when the area between each trench is considered as
803 reserve area. For clay loam soils that have percolation rates greater than 60 min/in., the nine (9)
804 foot spacing shall also be required but it is not considered as reserve area.

805

806 (ix) Chambered beds shall conform to the same requirements for chambered
807 trenches as found in subparagraphs (viii)(A through D) of this section. Aggregate, as specified in
808 subparagraph (vi)(B) of this section, or native soil shall be used to fill the space between the
809 chambers.

810

811 (x) Serial Sidehill Trench:

812

813 (A) A minimum of six (6) feet of undisturbed soil shall be maintained
814 between adjacent trench or bed side walls.

815

816 (B) The bottom of each serial trench or bed system shall be level.

817

818 (C) The overflow pipe between serial soil absorption systems shall be set no
819 higher than the mid-point of the upstream distribution pipe. The overflow pipe shall not be
820 perforated.

821

822 (b) A design package for standard soil absorption systems is provided online at the
823 Division's website to assist the applicant in submitting a completed application for coverage
824 under the general permit for small wastewater systems. The worksheet and calculations were
825 prepared by a registered professional engineer employed by the Wyoming Department of
826 Environmental Quality, Water Quality Division. The general design requirements stated in this
827 section are incorporated into the worksheets such that by properly completing the forms and
828 installing the components, the system will comply with these requirements.

829

830 **Section 12. Pressure Distribution Systems.**

831

832 (a) General Design Requirements:

833

834 (i) The basic elements of a pressure distribution system include a dosing tank,
835 filter, and a means to deliver specified doses to a small diameter pipe network within a soil
836 absorption system. Pressure distribution is required for mound systems or for bed systems with a
837 width greater than twenty-five (25) feet.

838

839 (ii) Pumps must be sized to match the distribution system curve or demand.
840 Pumps shall be designed for sewage pumping applications and be accessible from the ground
841 surface.

842

843 (iii) The control system for the pump and dosing tank shall, at a minimum, consist
844 of a "pump off" switch, a "pump on" switch, and a "high liquid alarm".

891
892

(A) All electrical connections must be made outside of the chamber in either an approved weatherproof box or an explosion-proof junction box.

(B) The wiring from the junction box to the control box must pass through a sealing fitting to prevent corrosive gases from entering the control panel.

(C) All wires must be contained in solid conduit from the dosing chamber to the control box.

(iv) The pressure transport piping between the tank and the soil absorption system shall be designed to prevent freezing.

(A) The ends of lateral piping shall be constructed with long sweep elbows or an equivalent method to bring the end of the pipe to finished grade. The ends of the pipe shall be provided with threaded plugs, caps, or other devices to allow for access and flushing of the lateral.

(B) All joints in the manifold, lateral piping, and fittings shall be solvent-welded using the appropriate joint compound for the pipe material. Pressure transport piping may be solvent-welded or flexible gasket jointed.

(C) Where automatic siphons or other devices are used, they shall be designed to empty the dosing tank in less than ten (10) minutes.

(v) The pressure distribution system shall have a combination of at least three (3) vertical feet of filter sand and/or unsaturated native soil above the high groundwater level. The filter sand shall conform to ASTM C-33, with less than 2% passing the #200 sieve.

(b) A design package for pressure distribution systems is provided online at the Division's website to assist the applicant in submitting a completed application for coverage under the general permit for small wastewater systems. The worksheet and calculations were prepared by a registered professional engineer employed by the Wyoming Department of Environmental Quality, Water Quality Division. The general design requirements stated in this section are incorporated into the worksheets such that by properly completing the forms and installing the components, the system will comply with these requirements.

Section 13. Sand Mound Systems.

The sand mound consists of a sand fill, an aggregate bed and a soil cap.

(a) Selection Criteria:

The high groundwater level, bedrock, or impervious clay layer is less than four (4) feet below the bottom of the soil absorption system excavation.

(b) Site Requirements:

893 (i) A minimum of one (1) foot of vertical separation of the native soil is required
894 between the bottom of the sand fill and the top of the high groundwater level, any restrictive
895 layer, or any highly permeable material.

896

897 (ii) The percolation rate of the native soil at the interface of the sand fill shall be
898 greater than five (5) and less than sixty (60) minutes per inch (5-60 mpi). The percolation shall
899 be measured in the top twelve (12) inches of native soil.

900

901 (c) General Design Requirements:

902

903 (i) Sand Layer

904

905 (A) Filter sand shall conform to ASTM C-33, with less than two percent
906 (2%) passing through the #200 sieve.

907

908 (B) The minimum depth of sand below the aggregate bed surface shall be
909 one (1) foot.

910

911 (C) The sand mound shall have a combination of at least four (4) vertical feet
912 of filter sand and unsaturated native soil above the high groundwater level.

913

914 (I) For sand mounds using pressure distribution systems, the depth
915 to high groundwater shall be three (3) feet below the bottom of the absorption surface if the
916 percolation rate of the soil is five (5) minutes per inch or greater (5-60 mpi).

917

918 (D) The top of the sand layer under the aggregate bed shall be level in all
919 directions.

920

921 (E) The sand layer shall fill around the perimeter of and to the top of the
922 aggregate bed.

923

924 (F) The slope of all sides shall be three (3) horizontal to one (1) vertical or
925 flatter. The side slopes shall be graded to prevent seepage and/or ponding at the bottom of the
926 slope.

927

928 (G) The infiltration area which is the bottom of the sand fill shall be
929 calculated by dividing the design flowrates (gpd) from Table 1 or Table 2 by the loading rate
930 (gpd/ft²) found in Table 5.

931

932 (ii) Aggregate Bed

933

934 (A) The aggregate shall be crushed rock, gravel or other acceptable, durable
935 and inert material which is free from fines, and has an effective diameter between one-half (1/2)
936 inch and two and one half (2 1/2) inch.

937

938 (B) The aggregate bed depth shall not be less than nine (9) inches with a
939 minimum of six (6) inches of clean aggregate placed below the distribution pipe and two (2)
940 inches above the distribution pipe. The aggregate shall be covered with an approved geotextile
941 material after installation and testing of the pressure distribution system.

942

943 (C) The design shall be a long, narrow bed design with a maximum width of
944 twenty-five (25) feet.

945

946 (D) The infiltration area, which is the bottom of the aggregate bed, shall be
947 calculated by dividing the design flowrates (gpd) from Table 1 and Table 2 by the loading rate of
948 0.8 gpd/ft².

949

950 (iii) Soil Cover

951

952 (A) The soil cap shall be constructed of a sandy loam, loamy sand, or silt
953 loam. The depth of the soil cap shall be at least six (6) inches at the edges to twelve (12) inches
954 at the center. The slope of all sides shall be three (3) horizontal to one (1) vertical or flatter.

955

956 (B) A layer of top soil at least six (6) inches thick shall be placed over the
957 entire sand mound area. The sand mound should be planted with vegetation that does not require
958 watering and will not establish deep roots. Native grasses are commonly used.

958

959 (d) A design package for sand mound systems is provided online at the Division's
960 website to assist the applicant in submitting a completed application for coverage under the
961 general permit for small wastewater systems. The worksheet and calculations were prepared by a
962 registered professional engineer employed by the Wyoming Department of Environmental
963 Quality, Water Quality Division. The general design requirements stated in this section are
964 incorporated into the worksheets such that by properly completing the forms and installing the
965 components, the system will comply with these requirements.

966

967 **Section 14. Small Wastewater Lagoons.**

968

969 (a) Selection Criteria:

970

971 (i) Lagoons shall only be considered in areas of Wyoming where the annual
972 evaporation exceeds the annual precipitation during the active use of the lagoon.

973

974 (ii) Lagoons shall only be allowed when the percolation rate exceeds sixty (60)
975 minutes per inch and the soil extends vertically down at least two (2) feet from the bottom of the
976 lagoon to the seasonal high groundwater table or bedrock formations.

977

- 978 (iii) A lagoon shall not be constructed within the 100 year flood plain.
 979
 980 (b) General Design Requirements:
 981
 982 (i) Beyond the horizontal setback distances requirements specified in Section 6(g)
 983 of this rule, the lagoon shall not be placed within one hundred (100) feet of the owner's property
 984 line.
 985
 986 (ii) The use of a septic tank which meets the specifications in Section 9 of this rule
 987 shall be required before the small wastewater lagoon.
 988
 989 (iii) The lagoon shall be located and constructed so it will not receive surface runoff
 990 water.
 991 (iv) The slope of the lagoon site shall not exceed five percent (5%).
 992 (v) The lagoon site must be located in an area of maximum exposure to sun and
 993 wind.
 994
 995 (vi) The lagoon shall be designed for complete retention.
 996
 997 (vii) The area of the lagoon shall be calculated based on the following formula.

998

999

$$A = \frac{584 \times Q}{(365 \times S) + (E - P)}$$

1000

1001 A = Area of the lagoon (in square feet) at the maximum operating depth of five (5) feet.

1002

1003 Q = Average daily sewage flow, gallons per day. (Multiply values from Table 1 or 2 by
 1004 0.6 to get average daily flow.)

1005

1006 E = Average annual lake evaporation in inches per year. (Note: lake evaporation is less
 1007 than pan evaporation; lake evaporation equals pan evaporation times a pan coefficient of 0.7)

1008

1009 P = Average annual precipitation rate in inches per year.

1010

1011 S = Seepage rate in decimal form, in inches per day.

1012

1013 (viii) The slopes of the dikes shall not be steeper than three (3) horizontal to one (1)
 1014 vertical. The minimum width of the top of the dike shall be four (4) feet.

1015

1016 (ix) All fill shall consist of impervious material that is well compacted and free of
 1017 rocks, frozen soil, or other large material.

1018

1019 (x) The minimum operating depth shall be two (2) feet. The dikes shall provide a
 1020 minimum freeboard of two (2) feet.

1021

1022 (xi) The floor of the lagoon shall be level and maintained free of all vegetation.

1023

- 1024 (xii) The influent line into the lagoon must discharge near the center.
1025
1026 (xiii) A cleanout or manhole shall be provided in the influent line near the dike.
1027
1028 (xiv) The area around the small wastewater lagoon shall be fenced to preclude the
1029 entrance of livestock, pets, and humans. The fence shall be equipped with a locking gate. The
1030 gate shall have a sign indicating “NO TRESPASSING – WASTEWATER LAGOON”.
1031
1032 (c) A design package for a small wastewater lagoons is provided online at the Division’s
1033 website to assist the applicant in submitting a completed application for coverage under the
1034 general permit for small wastewater systems. The worksheet and calculations were prepared by a
1035 registered professional engineer employed by the Wyoming Department of Environmental
1036 Quality, Water Quality Division. The general design requirements stated in this section are
1037 incorporated into the worksheets such that by properly completing the forms and installing the
1038 components, the system will comply with these requirements.

1039
1040 **Section 15. Privies.**

1041
1042 Pre-fabricated privies and outhouses shall be sealed, water-tight vaults and shall meet the
1043 following conditions.

- 1044
1045 (a) The horizontal setback distance requirements for sealed privies shall comply with
1046 Section 6(g) for septic tanks.
1047
1048 (b) The depth to seasonally high groundwater from the bottom of a water tight vault shall
1049 be sufficient to prevent floatation of the empty vault.
1050
1051 (c) The vault must have sufficient capacity for the dwelling served, and must have at
1052 least 27 cubic feet or 200 gallons of capacity.
1053
1054 (d) The privy must be easily maintained and insect tight. The door must be self-closing.
1055 The privy seat must include a cover. All exterior openings, including vent openings, shall be
1056 screened.
1057
1058 (e) Privies must be adequately vented.
1059
1060 (f) Privies shall not be constructed within the 100 year flood plain.
1061
1062 (g) A design package for privies is provided online at the Division’s website to assist the
1063 applicant in submitting a completed application for coverage under the general permit for small
1064 wastewater systems. The worksheet and calculations were prepared by a registered professional
1065 engineer employed by the Wyoming Department of Environmental Quality, Water Quality
1066 Division. The general design requirements stated in this section are incorporated into the
1067 worksheets such that by properly completing the forms and installing the components, the system
1068 will comply with these requirements.
1069

1070 **Section 16. Greywater Systems.**
1071

1072 It is the intent of this section to encourage and facilitate the productive and safe reuse of
1073 greywater from domestic wastewater.

1074
1075 (a) Applicability

1076
1077 (i) This section applies to any person who utilizes greywater for beneficial
1078 irrigation uses.

1079
1080 (ii) This section is not applicable if the intent is to provide blackwater treatment.

1081
1082 (iii) A city, county, or other local government agency may, after a public hearing
1083 and enactment of an ordinance or resolution, further restrict or prohibit the use of greywater
1084 systems.

1085
1086 (b) Greywater Operation and Requirements

1087
1088 (i) Restrictions

1089
1090 (A) Spray irrigation of greywater is not permitted.

1091
1092 (B) The installation of a greywater system shall not reduce or alter the
1093 sizing requirements of the onsite wastewater system.

1094
1095 (C) Human, domestic pets, and animal contact with greywater and soil
1096 irrigated with greywater shall be minimized.

1097
1098 (D) Greywater shall not leave the property on which it is generated.
1099 Ponding or runoff is prohibited.

1100
1101 (E) Water which has been used to wash diapers or similarly soiled or
1102 infectious garments shall not enter the greywater system and shall be diverted into the sanitary
1103 sewer or septic system.

1104
1105 (F) Water which contains hazardous materials such as paint, solvents,
1106 petroleum products, oil, gasoline, antifreeze, solvents, pesticides and herbicides shall not enter the
1107 greywater system. Greywater shall not contain hazardous chemicals derived from activities such
1108 as cleaning car parts, washing greasy or oily rags, or disposing of wastewater solutions from
1109 home photo labs or similar hobbyist or home occupational activities.

1110
1111 (G) Greywater systems shall not be installed in a delineated floodplain.

1112
1113 (H) The volume of greywater shall not exceed an average of 2000 gallons
1114 per day.

1115
1116 (I) Greywater shall not come in direct contact with or adversely impact
1117 surface or groundwater.

1118
1119 (J) Filter backwash water and flush water shall not be used for any
1120 purpose. The filter backwash and flush discharge shall be contained and disposed of into the

1121 building sewer system or septic tank with a design capacity to accept all the blackwater and
1122 greywater. Sanitary procedures shall be followed when handling filter backwash and flush
1123 discharge or greywater.

1124

1125 (ii) Odor control of the greywater system shall meet the requirement of
1126 Wyoming DEQ Air Quality Regulations Chapter 2, Section 11.

1127

1128 (iii) Stormwater

1129

1130 (A) The greywater system shall not be located in a drainage way.

1131

1132 (B) The greywater system shall prevent storm runoff from carrying the
1133 greywater off of the application site.

1134

1135 (iv) If the greywater system is to be used during the winter, the greywater system
1136 shall be designed to prevent freezing.

1137 (c) Estimating Greywater Discharge

1138

1139 (i) The greywater discharge for single family and multi-family dwellings shall be
1140 calculated by estimates of greywater use based on water use records, or the following procedure:

1141

1142 (A) The number of occupants of each dwelling unit shall be calculated as 2
1143 occupants per bedroom.

1144

1145 (B) The estimated greywater flows of each occupant shall be calculated in
1146 gallons per day (gpd) as follows:

1147

1148 Showers, bathtubs and wash basins – 25 gpd/occupant

1149

1150 Laundry – 15 gpd/occupant

1151

1152 (ii) The total number of occupants shall be multiplied by the applicable estimated
1153 greywater discharge as provided above and the type of fixtures connected to the greywater
1154 system.

1155

1156 (d) Greywater Components and Configurations

1157

1158 (i) Flow Diversion

1159

1160 (A) All greywater systems shall have a flow diverter which directs
1161 greywater to either the blackwater system or the greywater system.

1162

1163 (B) Diverter valves shall not have the potential to allow backflow from the
1164 blackwater system into the greywater system.

1165

1166 (C) Pipe elbows with rotatable compression fittings or equivalent
1167 components may be used to connect greywater sources with the greywater system or blackwater
1168 system if the pipe can only be connected to one system at a time. A capping device such as a

1169 rubber slip cap with band clamp shall be used to seal the plumbing of the system that is not in
1170 use.

1171
1172 (D) The rubber discharge hose from a laundry washing machine may be
1173 moved between a vertical blackwater riser pipe and a vertical greywater riser pipe without the
1174 need for a diverter valve.

1175
1176 (ii) Greywater Collection Tank

1177
1178 (A) When the greywater system design includes a tank, specifications for
1179 the tank shall be submitted for approval. Such plans shall show all dimensions and other
1180 pertinent data.

1181
1182 (B) Shall be constructed of solid, durable materials not subject to excessive
1183 corrosion or decay and shall be water-tight.

1184
1185 (C) Shall be structurally designed to withstand all anticipated earth or other
1186 loads. Tank covers shall be capable of supporting an earth load of not less than three hundred
1187 (300) pounds per square foot when the tank is installed underground.

1188
1189 (D) Shall be covered to prevent access by flying insects, rodents, domestic
1190 animals and people.

1191
1192 (E) Shall be vented with a suitable screen to keep animals and insects out
1193 of the system.

1194
1195 (F) Inside collection tank shall be installed in accordance with the
1196 International Building Code for internal plumbing for black water.

1197
1198 (G) Shall not hold greywater for more than 24 hours.

1199
1200 (H) Overflow Requirements:

1201
1202 (I) Each tank shall have an overflow drain. The overflow drain
1203 shall have a permanent connection to the building drain or building sewer, upstream of septic
1204 tanks, if any. The overflow drain shall not be equipped with a shutoff valve.

1205
1206 (II) The overflow drain shall not be less in diameter than the inlet
1207 pipe.

1208
1209 (III) The overflow system must be designed so that the tank overflow
1210 will drain by gravity to the existing sewer line or septic tank. The tank shall be protected against
1211 sewer line backflow by a check valve.

1212
1213 (iii) Piping

1214
1215 (A) Greywater conveyance pipes shall be permanently labeled for
1216 Greywater or shall be colored purple. Non-paint marking pens are unacceptable as permanent
1217 labeling.

1218
1219 (B) Gravity flow pipes shall be constructed to allow complete draining of
1220 the pipe.

1221
1222 (C) Pressurized pipe systems shall be constructed and designed to be
1223 drained or the water evacuated by compressed air for winterization.

1224
1225 (iv) Disinfection

1226
1227 (A) All greywater to be used for surface irrigation shall be disinfected.

1228
1229 (B) Disinfection may be accomplished through chemical methods or
1230 ultraviolet disinfection systems.

1231
1232 (I) Chemical disinfection

1233
1234 (1.) Chemical disinfection methods include the use of iodine,
1235 chlorine, or bromine.

1236
1237 (2.) Chemical disinfection shall provide the proper dosage of
1238 disinfection to achieve a fecal coliform level of 200/100 mL or less.

1239
1240 (II) Ultraviolet disinfection systems

1241
1242 (1.) Ultraviolet (UV) disinfection systems shall be designed
1243 and installed according to the manufacturer recommendations.

1244
1245 (2.) Greywater disinfected by a UV disinfection system shall
1246 have a UV transmittance less than the UV transmittance rated by the manufacturer.

1247
1248 (3.) The max flow rate of the UV disinfection system shall not
1249 be exceeded.

1250
1251 (e) Setbacks

1252
1253 (i) A 30 foot buffer zone is required between the greywater application site and
1254 adjacent property lines and any public right-of-way. This buffer zone requirement may be met by
1255 the use of a subsurface drip irrigation system.

1256
1257 (ii) A 30 foot separation distance is required between greywater application sites
1258 and all surface waters.

1259
1260 (iii) A 100 foot separation distance is required between greywater application sites
1261 and all potable water supply wells.

1262
1263 (f) Greywater Applications.

1264
1265 (i) General

1266

1267 (A) Each zone of an irrigation field must be of adequate size to receive the
1268 greywater anticipated in that zone.

1269
1270 (B) No irrigation or disposal field shall extend within three (3) vertical feet
1271 of the highest known seasonal groundwater, or to a depth where greywater contaminates the
1272 groundwater or surface water.

1273
1274 (C) Permeable pipe systems designed for greywater shall be installed
1275 according to manufacturer's recommendations.

1276
1277 (ii) Subsurface Irrigation

1278
1279 (A) Subsurface irrigation with greywater may be used to irrigate land and
1280 vegetation.

1281
1282 (B) Food crops for direct human consumption shall not be harvested for 30
1283 days after application of greywater.

1284
1285 (C) Subsurface irrigation shall not overwhelm the absorption system
1286 leading to overland flow.

1287
1288 (D) Mulch Basins

1289
1290 (1.) The total irrigation and/or mulch basin area required must be
1291 equal to the estimated greywater discharge (gpd) divided by the absorption capacity (gpd/ft²).

1292
1293 (2.) Shall be sized to provide sufficient depth, length and width to
1294 prevent ponding or runoff during the greywater surge of a clothes washer, bathtub or shower.
1295 Mulch shall be replenished as required due to decomposition of organic matter. Mulch basins
1296 will require periodic maintenance, reshaping or removal of dirt to maintain surge capacity,
1297 accommodate plant growth, and prevent ponding or runoff.

1298
1299 (3.) Shall not be deeper than the root zone of the plants to be
1300 irrigated.

1301
1302 (4.) Free Flow Outlets

1303
1304 a. Greywater shall be applied at the top of the mulch.

1305
1306 b. Application point(s) shall be protected from access by
1307 flying insects, rodents, domestic animals and people. Protections shall be constructed to allow
1308 easy access for cleaning and maintenance.

1309
1310 c. Inlet piping to the mulch basin shall be no less than 1 inch
1311 higher than the surface to which it is applied to allow for free fall of water.

1312
1313 (5.) Sub-mulch Outlets

1314

1315 a. Greywater shall be applied below the surface of the mulch
1316 into one or more distribution chambers constructed of perforated material.

1317
1318 b. Inlet piping to distribution chamber of the mulch basin
1319 shall be no less than 2 inches higher than the surface to which it is applied to allow for free fall of
1320 water.

1321 c. Distribution chamber shall be constructed for easy
1322 cleaning and maintenance.

1323
1324 (6.) A compost pile shall meet the requirements of a mulch basin.

1325
1326 (E) Drip Systems

1327
1328 (1.) Shall be filtered prior to the point of application or shall be
1329 designed to prevent frequent clogging.

1330
1331 (2.) Discharge nozzles shall be specifically designed for the
1332 application of greywater without clogging.

1333
1334 (3.) Drilled pipe drip system holes shall be no smaller than ¼ inches
1335 in diameter.

1336
1337 (4.) Point of application flow shall be low enough to prevent any
1338 surface flow of greywater.

1339
1340 (iii) Surface Irrigation

1341
1342 (A) Greywater used for surface irrigation shall receive a level of
1343 disinfection so the maximum fecal coliform level is 200/100 mL or less.

1344
1345 (B) Surface irrigation with greywater that has been treated by disinfection
1346 may be used for irrigation of land and vegetation.

1347
1348 (C) Flood irrigation

1349
1350 (1.) Shall not cause channeling or erosion of the application site.

1351
1352 (2.) Shall use a distribution system to evenly distribute flows across
1353 the site.

1354
1355 (3.) Shall not pond in excess of ¼ inch in depth.

1356
1357 (4.) Greywater shall not remain on the ground surface for more than
1358 15 minutes after source flow has stopped.

1359
1360 (g) A design package for greywater systems is provided online at the Division's website
1361 to assist the applicant in submitting a completed application for coverage under the general permit
1362 for small wastewater systems. The worksheet and calculations were prepared by a registered
1363 professional engineer employed by the Wyoming Department of Environmental Quality, Water

1364 Quality Division. The general design requirements stated in this section are incorporated into the
1365 worksheets such that by properly completing the forms and installing the components, the system
1366 will comply with these requirements.
1367

1368 **Section 17. Operation and Maintenance.**

1369
1370 (a) For any system that disposes of wastewater through land application or subsurface
1371 filtration, the owner shall not add any chemical or biochemical additive to the system that would
1372 adversely affect the quality of the groundwater as stated in the WDEQ Water Quality Rules &
1373 Regulations, Chapter 8.

1374
1375 (b) Septic tanks shall be pumped as needed to prevent solids carryover into the soil
1376 absorption system.

1377
1378 (c) Holding tanks and sealed vaults shall be pumped prior to reaching their maximum
1379 capacity.

1380
1381 (d) Any service provider that pumps septic tanks, holding tanks, or sealed vaults, shall
1382 dispose of the wastewater contents at a permitted wastewater treatment facility or in a manner
1383 approved by the Division or delegated authority.

1384
1385 (e) Damaged fittings and broken, crushed or plugged piping associated with any small
1386 wastewater system shall be replaced in a timely manner.

1387
1388 (f) Composting or non-discharging toilets, where permitted, shall have their waste
1389 disposed of at a permitted wastewater treatment facility or landfill, or in a manner approved by
1390 the Division or delegated authority.

1391
1392 **Section 18. Commercial and Industrial Wastes and/or Domestic Wastes Greater**
1393 **than 2000 Gallons Per Day.**

1394
1395 (a) Commercial/industrial wastewater systems or combination commercial/industrial and
1396 domestic wastewater systems are subject to applicable requirements listed in sections 1 through
1397 14 of this chapter, in addition to requirements in this section.

1398
1399 (b) If the wastewater is classified as, or determined to be hazardous, toxic, and/or contain
1400 petroleum products, the applicant shall demonstrate to the administrator that any discharge or
1401 seepage from the wastewater facility will not cause a violation of the surface and/or groundwaters
1402 of the state in accordance with Chapter 1, "Quality Standards for Wyoming Surface Waters" and
1403 Chapter 8, "Quality Standards for Wyoming Groundwaters."

1404
1405 (c) If the impact of the hazardous, toxic, and/or petroleum products cannot be
1406 determined and mitigated, disposal of the wastewater using a soil absorption system shall be
1407 prohibited.
1408

1409 (d) Pre-treatment of the wastewater to remove the hazardous, toxic, and/or petroleum
 1410 products shall be required prior to disposal if deemed necessary to protect the groundwater(s) and
 1411 surface water(s) of the state.

1412
 1413 (e) The minimum horizontal setback distances (in feet) shown in Table 7 shall be
 1414 maintained for commercial and industrial wastes and/or wastes greater than 2000 gallons per day
 1415 but less than 10,000 gallons per day.

1416
 1417

Table 7. Minimum Horizontal Setbacks for Commercial and Industrial Wastes¹

From	To Septic Tank Or Equivalent	To Absorption System
Wells (includes neighboring wells)	50	200
Public Water Supply Well	100	500 ²
Property Lines	10	10
Foundation Wall (w/o drains)	5	10
Foundation Wall (with drains)	5	50
Potable Water Pipes	25	50
Septic Tank	N/A	10
Surface Water, Spring (including seasonal and intermittent)	50	100
Cisterns	50	50

1418 ¹ For systems larger than 10,000 gallons per day, the isolation distance shall be determined by a
 1419 hydrogeological study in accordance with Section 17(b) of Chapter 3, but shall not be less than
 1420 those shown in Table 7.

1421
 1422 ² Wastewater systems that discharge to the same aquifer that supplies a public water supply well
 1423 and are located within Zone 1 or 2 (Attenuation) of the public water supply well, as determined
 1424 by [Wyoming Department of Environmental Quality Source Water Assessment Project \(2004\)](#) or
 1425 as established in [Section 2 of the Wyoming Wellhead Protection Guidance Document \(1997\)](#),
 1426 shall provide additional treatment. These systems will be required to obtain an individual permit
 1427 to construct and will require that a PE sign, stamp, and date the application, as stated in Section 2
 1428 of this chapter. The additional treatment shall be in accordance with Chapter 3, Section 2(b)(ii).
 1429 The treatment shall reduce the nitrates to less than 10 mg/L of NO₃- as N and provide 4-log
 1430 removal of pathogens before the discharge leaves the property boundary of each small wastewater
 1431 system.

1432
1433
1434
1435
1436
1437
1438
1439

APPENDIX A Percolation Test Procedure

Section 1. Purpose

(a) Percolation tests are used to determine absorption system site suitability and to size the absorption system.

Section 2. Procedure

(a) General Requirements:

(i) Percolation tests shall not be conducted in test holes which extend into groundwater, bedrock, or frozen ground.

(ii) The percolation test shall be conducted only after the soil exploration pit has been dug and examined.

(iii) A minimum of three (3) percolation test holes are required.

(iv) The percolation test holes shall be spaced uniformly over the proposed soil absorption system site.

(b) Preparation

(i) A twelve (12) inch diameter hole shall be dug or bored to the proposed depth of the soil absorption system.

(ii) The walls shall be vertical, with the natural soil surface exposed without smearing.

(iii) The sides and bottom shall be scarified with a sharp pointed instrument and the loose material shall be removed from the hole.

(iv) Two (2) inches of gravel or coarse sand shall be placed in the bottom of the hole to prevent it from scouring and sealing during water addition.

(c) Presoaking

(i) The purpose of presoaking is to have the water conditions in the soil reach a stable condition similar to that which exists during continual wastewater application. The minimum time of presoaking varies with soil conditions but must be sufficiently long so that the water seeps away at a constant rate. The following presoaking instructions are usually sufficient to obtain a constant rate.

(A) Fill each hole with clear water to a level at least eighteen (18) inches above the gravel or coarse sand. If the eighteen (18) inches of water seeps away in eighteen (18) minutes or less, add eighteen (18) inches of water a second time. If the second filling of eighteen

1481 (18) inches of water seeps away in eighteen (18) minutes or less, this indicates the soil is sandy
1482 and is excessively permeable. The soil absorption system shall meet the requirements of Section
1483 7 (c).

1484
1485 (B) If either the first or second fillings of eighteen (18) inches of water does
1486 not seep away in ninety (90) minutes, eighteen (18) inches of water must be maintained in the
1487 hole for at least four (4) hours to presoak the test hole. After the four (4) hours of water contact
1488 time, wait at least twelve (12) hours before starting the percolation rate measurement.

1489
1490 (d) Percolation Rate Measurement

1491 (i) Fill each test hole with twelve (12) inches of water and allow the soil to
1492 rehydrate for fifteen (15) minutes prior to any measurements.

1493 (ii) Establish a fixed reference point to measure the incremental water level drop at
1494 constant time intervals. The water level drop should be measured to the nearest 1/8 of an inch and
1495 the minimum time interval is ten (10) minutes.

1496 (iii) Refill the test hole to twelve (12) inches above the gravel before starting the
1497 measurements. Continue to measure the incremental water level drop at a constant time interval
1498 until a consistent incremental water level drop is achieved. A consistent water level drop is
1499 achieved when three (3) consecutive water level drops are within 1/8 inches of each other.

1500 (iv) Before the water level drops below one (1) inch above the gravel, refill the test
1501 hole to twelve (12) inches and continue to measure the incremental water level drop.

1502 (v) The percolation rate is calculated for each hole using the following formula:

1503
1504
$$\frac{\text{Time Interval (Minutes)}}{\text{Final Water Level Drop (inches)}} = \text{Percolation Rate (minutes/inch)}$$

1505 (vi) If only three to five percolation tests are performed, the design percolation rate
1506 for the absorption system is the largest rate from all the holes tested. If six or more percolation
1507 tests are performed, the design percolation rate for the absorption system is the average of all the
1508 holes tested as determined by the above formula.

1509 (e) The following information shall be recorded:

1510 (i) Date(s) of test(s);

1511 (ii) Location, diameter, and depth of each test hole;

1512 (iii) Duration of presoak;

1513 (iv) Time of day for beginning and end of each water-level drop interval;

1514 (v) Each water-level drop measurement;

1515 (vi) Calculated percolation rate;

1527
1528
1529
1530
1531
1532
1533
1534

(vii) Name and signature of person performing test;

(viii) Name of owner or project name; and

(ix) Certification that the percolation test was done in accordance with Wyoming
Water Quality Rules and Regulations Chapter 25 Appendix A.

APPENDIX B Land Application of Domestic Septage in Remote Areas

Section 1. Restrictions and Requirements

To qualify for the land application of domestic septage in remote areas, the following conditions must be met.

(a) Location restrictions:

(i) Domestic septage generated on a specific property may be land applied on said property, and shall not be transported to another location for land application.

(ii) No land application of domestic septage shall occur within 1,000 feet of all adjacent properties.

(iii) No land application of domestic septage shall occur within 300 feet of a public road, permanent surface water body, or intermittent stream.

(b) Site restrictions:

(i) The land application of domestic septage shall only occur on those sites with established vegetation such as rangeland, pasture or hay meadows.

(ii) No more than 5,000 gallons of domestic septage per acre per year shall be land applied.

(iii) No land application of domestic septage shall occur where the site's slope exceeds five percent (5%) or where the depth to groundwater is less than four (4) feet.

(iv) The land application of domestic septage shall not occur between November 1 and May 1, or any other time when frozen or saturated ground conditions exists.

(v) No public access shall be allowed to any site where domestic septage has been applied for at least one (1) year following application.

(vi) No grazing animals shall be allowed access to any site where domestic septage has been land applied for at least thirty (30) days following application.

(c) Crop restrictions:

(i) No root crops shall be harvested from soils where domestic septage has been land applied for at least thirty-eight (38) months following application

(ii) No truck crops (harvested parts touch land surface) shall be harvested from soils where domestic septage has been land applied for at least fourteen (14) months following application.

1582 (iii) No commodity crops (other food, feed, and fiber crops whose harvested parts
1583 do not touch land surface) from soils where domestic septage has been land applied shall be
1584 harvested for at least thirty (30) days following application.

1585
1586 (iv) No turf shall be harvested from soils where domestic septage has been land
1587 applied for at least one (1) year following application.

1588
1589 (d) Reporting Requirements:

1590
1591 (i) The property owner shall notify the appropriate Department of Environmental
1592 Quality, Water Quality Division (DEQ/WQD) District Engineer prior to the land application of
1593 domestic septage to confirm the requirements and to arrange a possible DEQ/WQD inspection of
1594 the land application.

1595
1596 (ii) All records related to each septage application will be maintained for at least
1597 five (5) years.

1598
1599 (iii) There is a worksheet provided online at the Division's website that must be
1600 completed, signed, and returned to the DEQ/WQD, or the appropriate delegated local permitting
1601 authority, within 15 days of the land application.
